Unisys Part Number 4500 5287-100

Second Edition – February 2004

Unisys Corporation believes that the information in this document is accurate as of the publication date. The information in this document is subject to change without notice. Unisys Corporation assumes no responsibility for any errors that may appear in this document.

The pricing information in this document is believed to accurately reflect the current prices as of the publication date. However, Unisys Corporation, Microsoft Corporation, and Oracle provide no warranty on the pricing information in this document.

Benchmark results are highly dependent upon workload, specific application requirements, and systems design and implementation. Relative system performance will vary as a result of these and other factors. Therefore, TPC Benchmark C should not be used as a substitute for a specific customer application benchmark when critical capacity planning and/or product evaluation decisions are contemplated.

All performance data contained in this report was obtained in a rigorously controlled environment, and therefore results obtained in other operating environments may vary significantly. Unisys Corporation, Microsoft Corporation, and Oracle do not warrant or represent that a user can or will achieve similar performance expressed in transactions per minute (tpmC) or normalized price/performance (\$/tpmC). No warranty of system performance or price/performance is expressed or implied in this report.

Overview

This report documents the methodology and results of the TPC Benchmark C (TPC-C) conducted on the Unisys Corporation ES7000 Aries 420 Enterprise Server (16P). The operating system on the server was Microsoft Windows Server 2003, Datacenter Edition for 64-bit Itanium-based Systems. The database used was Oracle Database 10g Enterprise Edition. The operating system on the clients was Microsoft Windows 2003 Server. The clients ran Microsoft's Internet Information Server 6.0 and COM+.

TPC Benchmark Metrics

The standard TPC Benchmark C metrics, tpmC (transactions per minute), price per tpmC (three year capital cost per measured tpmC), and the availability date are reported as required by the benchmark specification.

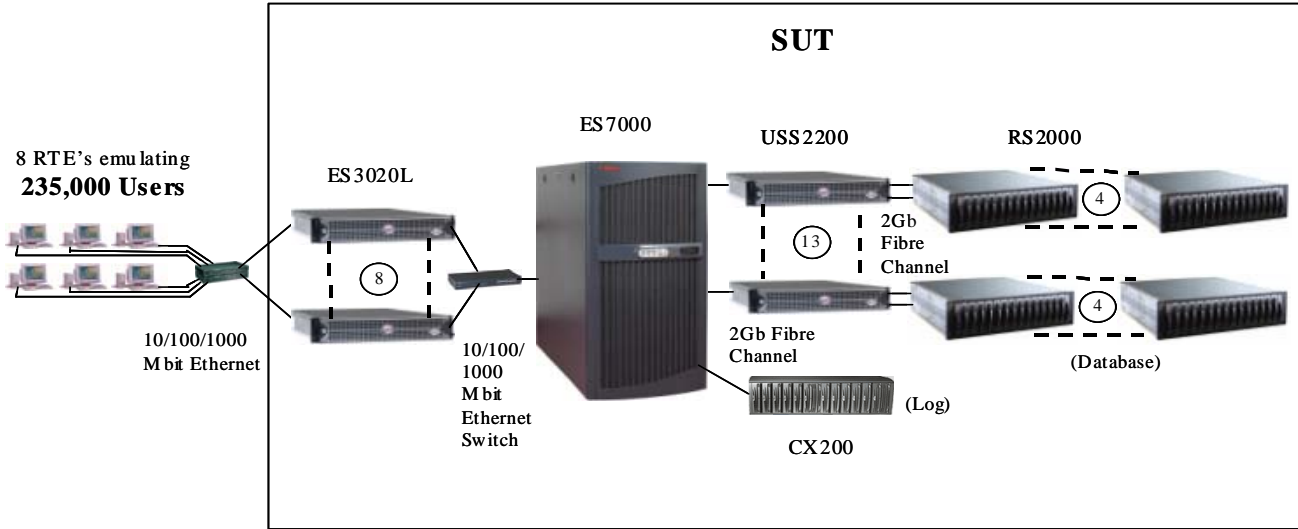

Executive Summary

The following pages contain the executive summary results of the benchmark.

Auditor

Lorna Livingtree of Performance Metrics, Inc., verified compliance with the relevant TPC specification, audited the benchmark configuration, environment, and methodology used to produce and validate the test results, along with the pricing model used to calculate the cost per tpmC.

UNISYS	ES7000 Aries 420 Enterprise Server		TPC-C Rev. 5.1

Benchmark results and test methodology audited by Lorna Livingtree of Performance Metrics, Inc.							
Prices used in TPC benchmarks reflect the actual prices a customer would pay for a one-time purchase of the stated components. Individually negotiated discounts are not permitted. Special prices based on assumption about past or future purchases are not permitted. All discounts reflect standard pricing policies for the listed components. For complete details, see the pricing sections of the TPC benchmarks specifications. If you find that the stated prices are not available according to these terms, please inform the TPC at pricing@tpc.org. Thank You.							

Numerical Quantities Summary

MQTh, Computed Maximum Qualified Throughput: 291,410.61 tpmC

Response Times, in seconds

Transaction	90th %ile	Average	Maximum
New-Order	0.96	0.43	11.66
Payment	0.93	0.40	12.02
Order-Status	0.96	0.43	11.73
Delivery (interactive portion)	0.75	0.28	10.72
Delivery (deferred portion)	0.20	0.13	9.94
Stock-Level	1.00	0.45	11.22
Menu	0.75	0.29	10.98

Response time delay added for emulated components, in seconds

RT Response time	0.1
Menu Response time	0.1

Transaction Mix, in percent of total transactions

New Order	44.87%
Payment	43.02%
Order-Status	4.03%
Delivery (interactive portion)	4.03%
Stock-Level	4.03%

Keying / Think Time Times, in seconds

Transaction	Minimum	Average	Maximum
New Order	18.01 / 0.00	18.01 / 12.03	18.08 / 120.31
Payment	3.01 / 0.00	3.01 / 12.03	3.08 / 120.31
Order-Status	2.01 / 0.00	2.01 / 10.08	2.06 / 100.70
Delivery (interactive portion)	2.01 / 0.00	2.01 / 5.06	2.08 / 50.61
Stock-Level	2.01 / 0.00	2.01 / 5.06	2.08 / 50.61

Test Duration

Ramp up time	83 minutes
Measurement interval (M)	120 minutes
Transactions (all types) completed during measurement interval	77,928,392
Ramp-down time	41 minutes

Document Structure

The TPC Benchmark C Standard Specification requires test sponsors to publish, submit to the TPC, and make available to the public, a full disclosure report for any result to be considered compliant with the specification. The required contents of the full disclosure report are specified in Clause 8.

This report is submitted to satisfy the specification's requirement for full disclosure. It documents the compliance of the benchmark implementation and execution reported for the Unisys ES7000 Aries 420 Enterprise Server (16P) using Oracle Database 10g Enterprise Edition on Microsoft Windows Server 2003, Datacenter Edition for 64-bit Itanium-based Systems.

TPC Benchmark C Overview

The Transaction Processing Performance Council (TPC) developed The TPC Benchmark™ C Standard Specification Revision 5.1. It is the intent of the TPC to develop a suite of benchmarks to measure the performance of computer systems executing a wide range of applications. Unisys, Microsoft Corporation, and Oracle are active participants in the TPC to define and develop such a suite of benchmarks.

TPC Benchmark™ C (TPC-C) is an OLTP workload. It is a mixture of read-only and update intensive transactions that simulate the activities found in complex OLTP application environments. It does so by exercising a breadth of system components associated with such environments, which are characterized by:

- The simultaneous execution of multiple transaction types that span a breadth of complexity.
- On-line and deferred transaction execution modes.
- Multiple on-line terminal sessions.
- Moderate system and application execution time.
- Significant disk input/output.
- Transaction integrity (ACID properties).
- Non-uniform distribution of data access through primary and secondary keys.
- Databases consisting of many tables with a wide variety of sizes, attributes, and relationships.
- Contention on data access and update.

The performance metric reported by TPC-C is a "business throughput" measuring the number of orders processed per minute. Multiple transactions are used to simulate the business activity of processing an order, and each transaction is subject to a response time constraint. The performance metric for this benchmark is expressed in transactions-per-minute-C (tpmC). To be compliant with the TPC-C standard, all references to tpmC results must include the tpmC rate, the associated price-per-tpmC, and the availability date of the priced configuration.

Despite the fact that this benchmark offers a rich environment that emulates many OLTP environments, this benchmark does not reflect the entire range of OLTP requirements. In addition, the extent to which a customer can achieve the results reported by a vendor is highly dependent on how closely TPC-C approximates the customer application. The relative performance of systems derived from this benchmark does not necessarily hold for other workloads or environments. Extrapolations to any other environment are not recommended.

0.1. Order and Titles

The order and titles of sections in the Test Sponsor's Full Disclosure report must correspond with the order and titles of sections from the TPC-C standard specification (i.e., this document). The intent is to make it as easy as possible for readers to compare and contrast material in different Full Disclosure reports. (8.1.1.1)

The order and titles of the sections in this report correspond with those from the TPC-C standard specification.

0.2. Executive Summary Statement

The TPC Executive Summary Statement must be included near the beginning of the Full Disclosure report. (8.1.1.2)

The TPC Executive Summary Statement is included near the beginning of this report.

0.3. Numerical Quantities Summary

The numerical quantities listed below must be summarized near the beginning of the Full Disclosure Report: (8.1.1.3)

- *Measurement interval in minutes,*
- *Number of checkpoints in the measurement interval,*
- *Checkpoint interval in minutes,*
- *Number of transactions (all types) completed within the measurement interval,*
- *Computed Maximum Qualified Throughput in tpmC,*
- *Ninetieth percentile, average and maximum response times for the New-Order, Payment, Order-Status, Stock-Level, Delivery (deferred and interactive) and Menu transactions,*
- *Time in seconds added to response time to compensate for delays associated with emulated components,*
- *Percentage of transaction mix for each transaction type.*

These numerical quantities are summarized near the beginning of this report.

0.4. Application Code Disclosure

The applicable program (as defined in Clause 2.1.7) must be disclosed. This includes, but is not limited to, the code implementing the five transactions and the terminal input and output functions. (8.1.1.4)

Appendix A contains the client application code used in this TPC-C benchmark. Appendix B contains the database code that implements the TPC-C transactions.

0.5. Benchmark Sponsor

A statement identifying the benchmark sponsor(s) and other participating companies must be provided. (8.1.1.5)

Unisys Corporation sponsored this TPC benchmark C. Unisys and Oracle Corporation developed the benchmark test. The benchmark was conducted at Unisys, Mission Viejo, California.

0.6. Parameter Settings

Settings must be provided for all customer-tunable parameters and options which have been changed from the defaults found in actual products, including but not limited to: (8.1.1.6)

- *Data Base tuning options*
- *Recovery/commit options*
- *Consistency/locking options*
- *Operating system and application configuration parameters*

Appendix C contains the configuration and system parameters used in running these TPC-C tests. It also contains all the client, server OS, and Oracle database tunable parameters.

0.7. Configuration Diagrams

Diagrams of both measured and priced configurations must be provided, accompanied by a description of the differences. This includes, but is not limited to: (8.1.1.7)

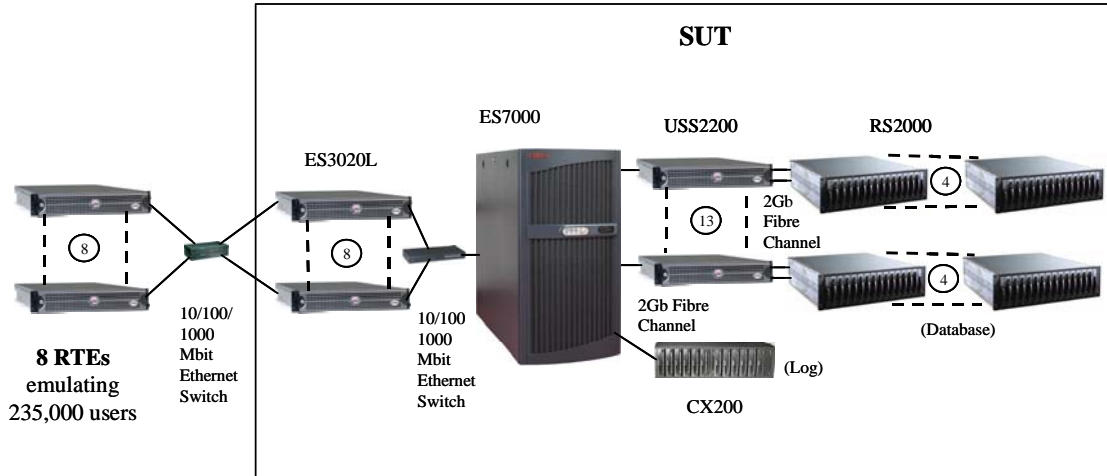

- *Number and type of processors.*
- *Size of allocated memory, and any specific mapping/partitioning of memory unique to the test.*
- *Number and type of disk units (and controllers, if applicable).*
- *Number of channels or bus connections to disk units, including their protocol type.*
- *Number of LAN (e.g., Ethernet) connections, including routers, workstations, terminals, etc., that were physically used in the test or are incorporated into the pricing structure (see Clause 8.1.8).*
- *Type and the run-time execution location of software components (e.g., DBMS, client processes, transaction monitors, software drivers, etc.).*

The Remote Terminal Emulator (RTE) software used for these TPC-C tests is proprietary to Unisys. The benchmarked configuration of the RTE and Unisys ES7000 Aries 420 Enterprise Server (16P) is illustrated in Figure 0.1. Table 4.3 contains a detailed explanation of the disk configuration.

There were eight ES3020L clients in the measured configuration, seven older clients with dual 2.4 GHz processors, 400MHz FSB, 2GB memory, one 18 GB 10K rpm drive, and one new client with dual 2.4GHz processors, 533 MHz FSB, 2GB memory, one 18 GB 15Krpm drive. The pricing uses eight new ES3020L clients in the benchmark configuration, each with dual 2.4 GHz processors, 533 MHz FSB, 2GB memory and one 18 GB 15K rpm drive because the older measured clients are no longer orderable through Unisys.

The priced configuration for the Unisys ES7000 Aries 420 Enterprise Server (16P) is shown in Figure 0.2.

Figure 0.1: Benchmarked Configuration

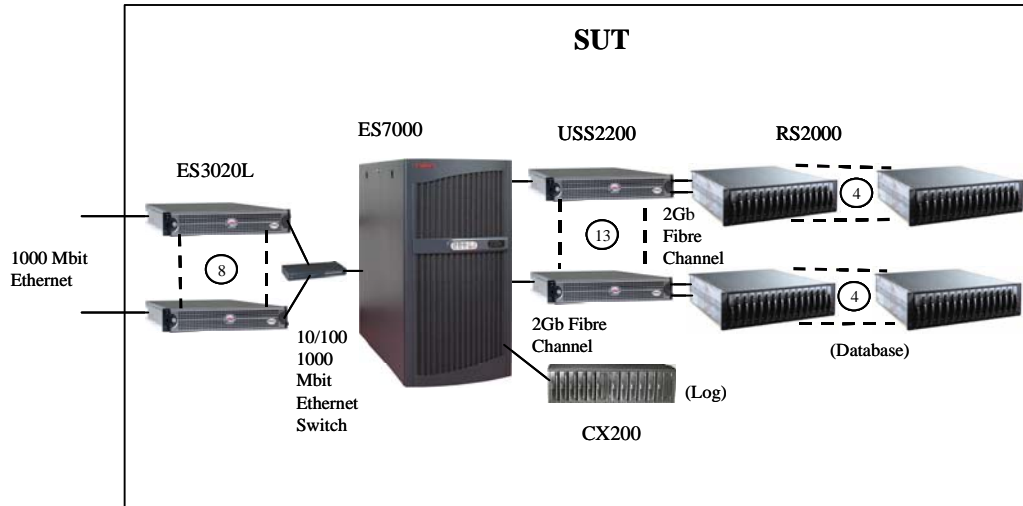

Clients (each of 8)
ES3020L Server
 2 x 2.4GHz Intel® Xeon™ Processor w/ 512KB L2 cache, 400MHz FSB, 2 GB memory, 1 x 18GB 10Krpm disk, 2 Inbuilt 10/100/1000Mb Ethernet controllers

ES7000 Aries 420 Enterprise Server
 16 x 1.5GHz Intel® Itanium® 2 Processor w/ 6MB iL3 cache, 128 GB memory, 2 x 36GB SCSI disks, 1 x PCI SCSI RAID controller, 8 x PCI Fibre Channel controllers, 1 x PCI Ethernet 10/100/1000Mb controller

Storage
USS2200/RS2000 & CX200
 728 x 18GB + 26 x 73GB Hot-Pluggable, External Fibre Channel disks, 15 x FC RAID controllers

Figure 0.2: Priced Configuration

Clients (each of 8)
ES3020L Server
 2 x 2.4GHz Intel® Xeon™ Processor w/ 512KB L2 cache, 533MHz FSB, 2 GB memory, 1 x 18GB 15Krpm disk, 2 Inbuilt 10/100/1000Mb Ethernet controllers

ES7000 Aries 420 Enterprise Server
 16 x 1.5GHz Intel® Itanium® 2 Processor w/ 6MB iL3 cache, 128 GB memory, 2 x 36GB SCSI disks, 1 x PCI SCSI RAID controller, 8 x PCI Fibre Channel controllers, 1 x PCI Ethernet 10/100/1000Mb controller

Storage
USS2200/RS2000 & CX200
 728 x 18GB + 26 x 73GB Hot-Pluggable, External Fibre Channel disks, 15 x FC RAID controllers

1.

Clause 1: Logical Database Design

1.1. Table Definitions

Listings must be provided for all table definition statements and all other statements used to setup the database. (8.1.2.1)

Appendix B contains the programs that define, create, and populate the Oracle Database 10g Enterprise Edition database.

1.2. Physical Organization of the Database

The physical organization of tables and indices, within the database, must be disclosed. (8.1.2.2)

The disk space was allocated to the Oracle database according to the data in Table 4.3. The Oracle definitions are contained in Appendix B.

1.3. Insert and/or Delete Operations

It must be ascertained that insert and/or delete operations to any of the tables can occur concurrently with the TPC-C transaction mix. Furthermore, any restriction in the SUT database implementation that precludes inserts beyond the limits defined in Clause 1.4.11 must be disclosed. This includes the maximum number of rows that can be inserted and the maximum key value for these new rows. (8.1.2.3)

There were no restrictions on insert and/or delete operations to any of the tables.

1.4. Partitioning

While there are few restrictions placed upon horizontal or vertical partitioning of tables and rows in the TPC-C benchmark (see Clause 1.6), any such partitioning must be disclosed. (8.1.2.4)

Partitioning was not used for any table in this implementation.

1.5. Replication, Duplication or Additions

Replication of tables, if used, must be disclosed (see Clause 1.4.6). (8.1.2.5).

Additional and/or duplicate attributes in any table must be disclosed along with a statement on the impact on performance (see Clause 1.4.7). (8.1.2.6)

No replications, duplications or additional attributes were used in this implementation.

2.

Clause 2: Transaction & Terminal Profiles

2.1. Random Number Generation

The method of verification for the random number generation must be disclosed. (8.1.3.1)

The drivers used the Unisys RTE program, which was independently audited.

2.2. Input/Output Screen Layout

The actual layout of the terminal input/output screens must be disclosed. (8.1.3.2)

The screen layouts are based on those in Clauses 2.4.3, 2.5.3, 2.6.3, 2.7.3, and 2.8.3 of the TPC Benchmark C Standard Specification. There are some minor differences in appearance due to the use of a web client implementation.

2.3. Priced Terminal Feature Verification

The method used to verify that the emulated terminals provide all the features described in Clause 2.2.2.4 must be explained. Although not specifically priced, the type and model of the terminals used for the demonstration in 8.1.3.3 must be disclosed and commercially available (including supporting software and maintenance). (8.1.3.3)

The above disclosure was verified by the auditor.

2.4. Presentation Managers or Intelligent Terminal

Any usage of presentation managers or intelligent terminals must be explained. (8.1.3.4)

Application code running on the client implemented the TPC-C user interface. A listing of this code is included in Appendix A. No presentation manager was used on the client, as screen manipulation and data input/output was handled for each user by the Microsoft Internet Explorer web browser running on each user PC.

2.5. Transaction Statistics

The percentage of home and remote order-lines in the New-Order transactions must be disclosed. (8.1.3.5)

The percentage of New-Order transactions that were rolled back as a result of an unused item number must be disclosed. (8.1.3.6)

The number of items per order entered by New-Order transactions must be disclosed. (8.1.3.7)

The percentage of home and remote Payment transactions must be disclosed. (8.1.3.8)

The percentage of Payment and Order-Status transactions that used non-primary key (C_LAST) access to the database must be disclosed. (8.1.3.9)

The percentage of Delivery transactions that were skipped as a result of an insufficient number of rows in the NEW-ORDER table must be disclosed. (8.1.3.10)

The mix (i.e., percentages) of transaction types seen by the SUT must be disclosed. (8.1.3.11)

Table 5.4 in Section 5 contains all of these statistics.

2.6. Queuing Mechanism of Delivery

The queuing mechanism used to defer execution of the Delivery transaction must be disclosed (8.1.3.12).

The client application processes submitted delivery transactions to server software running on the client machines. These delivery servers were responsible for processing queued deliveries to submit to the database server.

3.

Clause 3: Transaction & System Properties

3.1. Transaction System Properties (ACID)

The results of the ACID tests must be disclosed along with a description of how the ACID requirements were met. This includes disclosing which case was followed for the execution of Isolation Test 7. (8.1.4.1)

The TPC Benchmark C Standard Specification defines a set of transaction processing system properties that a system under test (SUT) must support during the execution of the benchmark. Those properties are Atomicity, Consistency, Isolation, and Durability (ACID).

This section defines each of these properties, describes the steps taken to ensure that they were present during the test and describes a series of tests done to demonstrate compliance with the specification. All ACID property tests were executed successfully.

3.2. Atomicity

The system under test must guarantee that data base transactions are atomic; the system will either perform all individual operations on the data, or will assure that no partially completed operations leave any effects on the data.

3.2.1. Completed Transaction

Perform the Payment transaction for a randomly selected warehouse, district, and customer (by customer number) and verify that the records in the CUSTOMER, DISTRICT, and WAREHOUSE tables have been changed appropriately.

The balances from a randomly selected warehouse, district, and customer row were retrieved by customer number from a script. A Payment transaction was submitted with the same warehouse, district and customer identifiers for a known amount. After completion of the Payment transaction, the balances of the selected warehouse, district, and customer were again retrieved to verify that the changes had been made correctly.

3.2.2. Aborted Transactions

Perform the Payment transaction for a randomly selected warehouse, district, and customer (by customer number) and substitute a ROLLBACK of the transaction for the COMMIT of the transaction. Verify that the records in the CUSTOMER, DISTRICT, and WAREHOUSE tables have NOT been changed.

The balances from a randomly selected warehouse, district, and customer row were retrieved by customer number from a script. A Payment transaction was submitted with the same warehouse, district and customer identifiers that issued a ROLLBACK command rather than a COMMIT. After the transaction completed, the balances of the selected warehouse, district, and customer were again retrieved to verify that no changes had been made to the database.

3.3. Consistency

Consistency is the property of the application that requires any execution of a data base transaction to take the data base from one consistent state to another, assuming that the data base is initially in a consistent state.

The benchmark specification requires explicit demonstration of the following four consistency conditions:

1. The sum of the district balances in a warehouse is equal to the warehouse balance;
2. For each district, the next order id minus one is equal to maximum order id in the ORDER table and equal to the maximum new order id in the NEW ORDER table;
3. For each district, the maximum order id minus minimum order id in the ORDER table plus one equals the number of rows in the NEW-ORDER table for that district;
4. For each district, the sum of the order line counts in the ORDER table equals the number of rows in the ORDER-LINE table for that district;

In order to demonstrate this consistency, the following steps were taken:

1. Prior to the start of a benchmark run, the consistency of the database was verified by testing successfully conditions 1-4 described above with a script.
2. A run under full user load was executed for over 10 minutes with a checkpoint during the run.
3. After completion of that test, the consistency of the database was again verified by successfully testing using the same consistency script as in step 1.

3.4. Isolation

For conventional locking schemes, isolation should be tested as described below. Systems that implement other isolation schemes may require different validation techniques. It is the responsibility of the test sponsor to disclose those techniques and the tests for them. If isolation schemes other than conventional locking are used, it is permissible to implement these tests differently provided full details are disclosed. (Examples of different validation techniques are shown in Isolation Test 7, Clause 3.4.2.7).

3.4.1. Isolation Test 1

This test demonstrates isolation for read-write conflicts of Order-Status and New-Order transactions.

Performed the following steps:

1. An Order-Status transaction T0 was executed for a randomly selected customer, and the order returned was noted. T0 was committed.
2. A New-Order transaction T1 was started for the same customer used in T0. T1 was stopped prior to COMMIT.
3. An Order-Status transaction T2 was started for the same customer used in T1. T2 completed and was committed without being blocked by T1. T2 returned the same order that T0 had returned.
4. T1 was allowed to complete and was committed.
5. An Order-Status transaction T3 was started for the same customer used in T1. T3 returned the order inserted by T1.

This result demonstrates serialization of T2 before T1. T3 returned the order inserted by T1.

3.4.2. Isolation Test 2

This test demonstrates isolation for read-write conflicts of Order-Status and New-Order transactions when the New-Order transaction is ROLLED BACK.

Performed the following steps:

1. An Order-Status transaction T0 was executed for a randomly selected customer, and the order returned was noted. T0 was committed.

2. A New-Order transaction T1 with an invalid item number, was started for the same customer used in T0. T1 was stopped immediately prior to ROLLBACK.
3. An Order-Status transaction T2 was started for the same customer used in T1. T2 completed and was committed without being blocked by T1. T2 returned the same order that T0 had returned.
4. T1 was allowed to ROLLBACK.
5. An Order-Status transaction T3 was started for the same customer used in T1. T3 returned the same order that T0 had returned.

3.4.3. Isolation Test 3

This test demonstrates isolation for write-write conflicts of two New-Order transactions.

Performed the following steps:

1. Start a New-Order transaction T1.
2. Stop transaction T1 immediately prior to COMMIT.
3. Start another New-Order transaction T2 for the same customer as T1.
4. Verify that transaction T2 waits.
5. Allow transaction T1 to complete. T2 should now complete.

Verify that the order number returned for T2 is one greater than the order number for T1. Verify that the value of D_NEXT_O_ID reflects the results of both T1 and T2, i.e., it has been incremented by two and is one greater than the order number for T2.

3.4.4. Isolation Test 4

This test demonstrates isolation for write-write conflicts of two New-Order transactions when one transaction is ROLLED BACK.

Performed the following steps:

1. The D_NEXT_O_ID of a randomly selected district was retrieved.
2. A New-Order transaction T1 which contains an invalid item number, was started for a randomly selected customer with the district used in step 1. T1 was stopped immediately prior to ROLLBACK.
3. Started another New-Order transaction T2 for the same customer as T1. Transaction T2 waited.
4. T1 was allowed to roll back. T2 completed and was committed.

The order number returned by T2 was the same as the D_NEXT_O_ID retrieved in step 1.

The D_NEXT_O_ID of the same district was retrieved again. It had been incremented by one (greater than the order number returned by T2).

3.4.5. Isolation Test 5

This test demonstrates isolation for write-write conflicts of Payment and Delivery transactions. Perform the following steps:

Performed the following steps:

1. A query was executed to find out the customer who would be updated by the next delivery transaction for a randomly selected warehouse and district.
2. The C_BALANCE of the customer found in step 1 was retrieved.

3. Started a Delivery transaction T1 for the same warehouse used in step 1. The T1 transaction was stopped immediately prior to COMMIT.
4. Started a Payment transaction T2 for the same customer found in step 1. T2 waited.
5. Transaction T1 was allowed to complete. Now T2 completed and committed.

Retrieved C_BALANCE and verified. It reflected the results of both T1 and T2.

3.4.6. Isolation Test 6

This test demonstrates isolation for write-write conflicts of Payment and Delivery transactions when the Delivery transaction is ROLLED BACK. Perform the following steps:

Performed the following steps:

1. A query was executed to find out the customer who would be updated by the next delivery transaction for a randomly selected warehouse and district.
2. The C_BALANCE of the customer found in step 1 was retrieved.
3. Started a Delivery transaction T1 for the same warehouse used in step 1. Stopped transaction T1 immediately prior to ROLLBACK.
4. Started a Payment transaction T2 for the same customer found in step 1. T2 waited.
5. Transaction T1 was allowed to ROLLBACK. Now T2 completed and committed.

Retrieved C_BALANCE and verified. It reflected the results of both T1 and T2.

3.4.7. Isolation Test 7

This test demonstrates repeatable reads for the New-Order transaction while an interactive transaction updates the price of an item. Given two random item number x and y, perform the following steps:

1. Started a transaction T1. Queried I_PRICE from items x and y. Transaction T1 was committed.
2. Start a New-Order transaction T2 for a group of items including item x twice and item y.
3. Transaction T2 was stopped after querying the price of item x a first time and immediately before querying the prices of item y and of item x a second time.
4. Started a transaction T3 to increase the price of items x and y by 10 percent.
5. Transaction T3 has completed and has been COMMITTED.
6. Continued transaction T2 and the price of items x (the second time) and y were retrieved again. These prices matched the values read by transaction T1.
7. Transaction T2 was committed.

The prices of items x and y were retrieved again. The values matched the values set by T3. Execution followed Case D of Clause 3.4.2.7.

3.4.8. Isolation Test 8

This test demonstrates phantom protection between New-Order and Delivery transactions.

Performed the following steps:

1. The NO_D_ID of all NEW_ORDER rows for a randomly selected warehouse and district was changed to 11 and were committed.
2. A delivery transaction T1 was started for the selected warehouse.

3. Transaction T1 was stopped immediately after reading the NEW_ORDER table for the selected warehouse and district. No qualifying row was found.
4. A New-Order transaction T2 was started for the same warehouse and district. T2 completed and was committed without being blocked by T1.
5. T1 completed and was committed.
6. The NO_D_ID of all NEW_ORDER rows for the selected warehouse and district was restored to the original value. The changes were committed.

Execution followed Case B of Clause 3.4.2.8.

3.4.9. Isolation Test 9

This test demonstrates phantom protection between New-Order and Order-Status transactions.

Performed the following steps:

1. An Order-Status transaction T1 was started for a randomly selected customer.
2. Transaction T1 was stopped immediately after reading the ORDER table for the selected customer. The most recent order for that customer was found.
3. A New-Order transaction T2 was started for the same customer. T2 completed and was committed without being blocked by T1.
4. Transaction T1 was resumed and the ORDER table was read again to determine the most recent order for the same customer. The order found was the same as the one found in step 2.
5. T1 completed and was committed.

Execution followed Case B of Clause 3.4.2.9.

3.5. Durability

The tested system must guarantee durability: the ability to preserve the effects of committed transactions and insure data base consistency after recovery from any one of the failures listed in Clause 3.5.3.

Three durability tests were executed to satisfy the requirements of the specification. The tests for loss of memory and instantaneous interruption were combined and performed with a fully scaled database with all emulated users. The loss of log and loss of data tests were also performed with 220,000 emulated users, but running at 20% of full load. To the best of our knowledge, these tests prove that the fully scaled configuration used for the throughput test would also meet all durability tests.

3.5.1. Loss of Log Disk and Loss of Data Disk

The following steps were taken with 220,000 emulated users to demonstrate durability in the case of loss of a log disk and loss of a data disk:

1. One data LUN of the database was backed up to extra space on a backup volume.
2. The Oracle database was started up. The D_NEXT_O_ID fields for all rows in the district table were summed up to determine the initial count of orders present in the database.
3. The RTE was started with all users at 20% of full load. On the driver systems, committed and rolled back New-Order transactions were recorded in a “success” file.
4. After five minutes of running at steady state, a hot-pluggable log disk was removed from the disk cabinet, with no effect on the OS or Oracle.
5. After 5 additional minutes of operation, a hot-pluggable data disk was removed from the data LUN.

6. Windows Server 2003 and Oracle encountered IO errors due to the missing disk and recorded these errors in the system event log and Oracle alert log, respectively. The RTEs also recorded errors.
7. The RTEs and then the clients were stopped.
8. A data disk was inserted in the disk cabinet to replace the one removed. The RAID controller, via Storage Sentinel Manager, was used to recreate the LUN. Partitions were made using Diskpart on the new LUN.
9. Data files from the backup LUN (step1) were restored on the new LUN. The missing log drive was not replaced.
10. The SUT was restarted, Oracle was then restarted and began the recovery process, which recovered all committed transactions to the database from the redo log file.
11. Consistency condition 3 of Clause 3.3.2.3 was executed to verify database consistency.
12. Step 2 was repeated to determine the total number of orders. This number was subtracted from the count obtained previously in Step 2 to determine the number of additional orders added to the database.
13. The contents of the “success” files on the drivers were sampled to verify that the records in the “success” file for committed New-Order transactions had corresponding records in the ORDER table. Moreover, the counts were matched with those obtained in step 12.

3.5.2. Instantaneous Interruption and Loss of Memory

Instantaneous interruption and loss of memory tests were combined because the loss of power erased the contents of memory. Removing the primary power to the System Under Test while the benchmark was executing induced this failure.

1. The D_NEXT_O_ID fields for all rows in the district table were summed up to determine the initial count of orders present in the database (count1).
2. On the driver systems, committed and rolled back New-Order transactions were recorded in a “success” file.
3. The benchmark was executed at full load with all emulated users for a minimum of 5 minutes.
4. The system’s primary power was then turned off.
5. After transaction failures were noted by the RTEs, the RTEs and clients were shut down.
6. Power was restored to the SUT, the system rebooted, the Oracle database was restarted, and automatic database recovery was performed. The database recovery used the transaction log to reapply all committed transactions and rollback any (in progress) uncommitted transactions, so that the database disks were correct.
7. After recovery finished, Consistency Condition 3 of Clause 3.3.2.3 (no gaps in NO_O_ID) was executed to verify that the database was consistent.
8. Finally, step 1 was repeated to determine the total number of orders (count2). Count2 minus count1 was not less than the number of committed New-Order records in the “success” file from the drivers.
9. The contents of the “success” files on the drivers were sampled to verify that the records in the “success” file for committed New-Order transactions had corresponding records in the ORDER table.

4.

Clause 4: Scaling & Database Population

4.1. Initial Cardinality of Tables

The Cardinality (e.g., the number of rows) of each table, as it existed at the start of the benchmark run (see Clause 4.2), must be disclosed. If the database was over-scaled and inactive rows of the WAREHOUSE table were deleted (see Clause 4.2.2), the cardinality of the WAREHOUSE table as initially configured and the number of rows deleted must be disclosed. (8.1.5.1)

The TPC-C database for this test was configured with 24,000 warehouses. The cardinality of each table in the database is listed in Table 4.1

Table 4.1: Initial Cardinality of Database Table

Table	Occurrences
Warehouse	24,000
District	240,000
Customer	720,000,000
History	720,000,000
Order	720,000,000
New-Order	216,000,000
Order-Line	7,200,996,928
Stock	2,400,000,000
Item	100,000

500 rows of the warehouse table were inactive while executing the measurement run.

4.2. Constant Values

The following values were used as the constant C input values to the NURand function during Build and Run time for this implementation.

Table 4.2: Constant C for NURand

Function	Value
C_LAST (Build)	0
C_LAST (Run)	85

4.3. Database Layout

The distribution of tables and logs across all media must be explicitly depicted for the tested and priced systems. (8.1.5.2)

Table 4.3 lists the distribution of the database over 728 18GB disks and the transaction log over 26 mirrored 73GB disks for the benchmark configuration. In addition, there were two mirrored 36GB disks in the host server containing Windows Server 2003, Datacenter Edition for 64-bit Itanium-based Systems, and Oracle 10g Database code plus the paging file. The tested and priced disk configurations were identical, except for the changes noted in Section 0.7.

4.4. DBMS: Data Model and DBMS Interface/Access Language

A statement must be provided that describes: (8.1.5.3)

1. *The data model implemented by the DBMS used (e.g., relational, network, hierarchical).*
2. *The database interface (e.g., embedded, call level) and access language (e.g., SQL, DL/1, COBOL, read/write) used to implement the TPC-C transactions. If more than one interface/access language is used to implement TPC-C, each interface/access language must be described and a list of which interface/access language is used with which transaction type must be disclosed.*

Oracle Database 10g Enterprise Edition is a relational DBMS.

The client software interfaced to the Oracle database using embedded SQL code via OCI (Oracle Call Interface). For details, see Appendix A.

4.5. DBMS Partitions/Replications

The mapping of database partitions/replications must be explicitly described. (8.1.5.4)

No table partitioning or replication was done.

4.6. DBMS Space Requirements

Details of the 60-day space computation along with proof that the database is configured to sustain 8 hours of growth for dynamic tables (Order, Order-line, and History) must be disclosed (see Clause 4.2.3) (8.1.5.5).

Appendix E lists the space requirements for the 60-day space as well as the logical log space for eight hours.

Table 4.3: Disk Configuration

External Disk Configuration							
HBA	USS	Logical Unit #	Drive #	RAID Level	Striping	Size (GB)	Database files

4x Itanium 2, 1.5GHz	32GB								

5. Clause 5: Performance Metrics & Response Time

5.1. Measured Throughput (tpmC)

Measured tpmC must be reported. (8.1.6.1)

The measured tpmC was 291,410.61.

5.2. Response Times

Ninetieth percentile, maximum and average response times must be reported for all transaction types as well as for the Menu response time. (8.1.6.2)

Table 5.1: Response Time Data

Transaction	Average	Maximum	90th %ile
New-Order	0.43	11.66	0.96
Payment	0.40	12.02	0.93
Order Status	0.43	11.73	0.96
Delivery (interactive)	0.28	10.72	0.75
Delivery (deferred)	0.13	9.94	0.20
Stock-Level	0.45	11.22	1.00
Menu	0.29	10.98	0.75

5.3. Keying and Think Times

The minimum, the average, and the maximum keying and think times must be reported for each transaction type. (8.1.6.3)

Table 5.2: Keying Times

Transaction	Minimum	Average	Maximum
New-Order	18.01	18.01	18.08
Payment	3.01	3.01	3.08
Order Status	2.01	2.01	2.06
Delivery (interactive)	2.01	2.01	2.08
Stock-Level	2.01	2.01	2.08

Table 5.3: Think Times

Transaction	Minimum	Average	Maximum
New-Order	0.00	12.03	120.31
Payment	0.00	12.03	120.31
Order Status	0.00	10.08	100.70
Delivery (interactive)	0.00	5.06	50.61
Stock-Level	0.00	5.06	50.61

5.4. Response Time Frequency Distribution Curves

Response Time frequency distribution curves (see Clause 5.6.1) must be reported for each transaction type. (8.1.6.4)

Figure 5.1: New Order Response Time Distribution

Figure 5.2: Payment Response Time Distribution

Figure 5.3: Order Status Response Time Distribution

Figure 5.4: Delivery Response Time Distribution

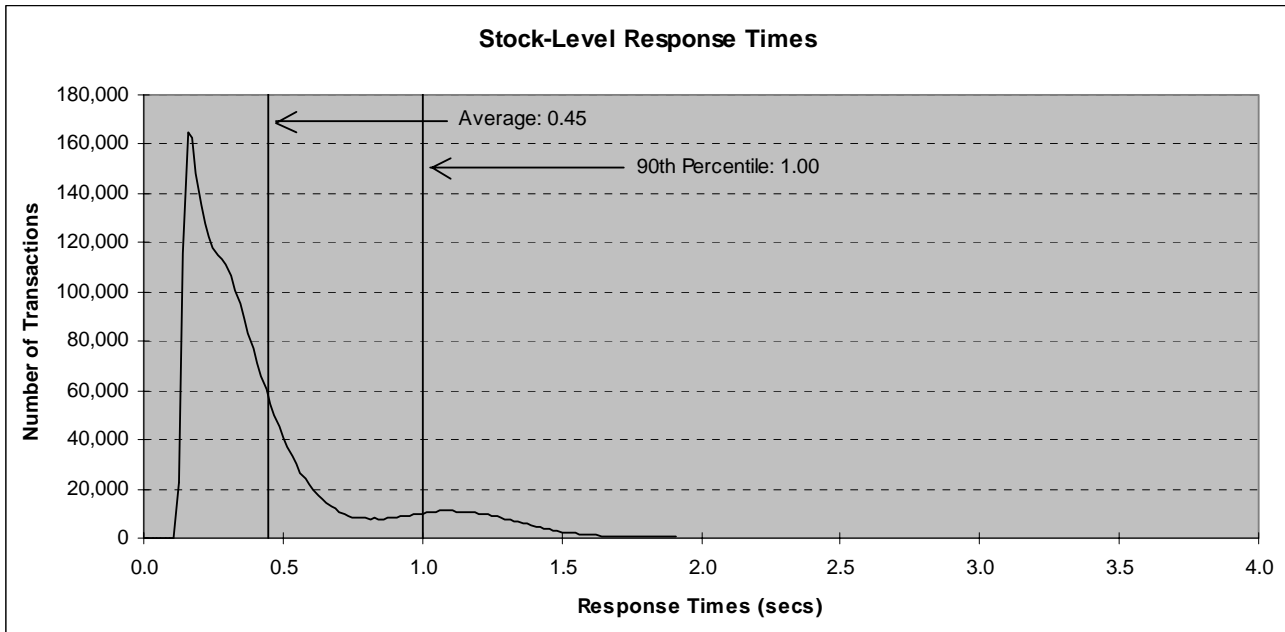

Figure 5.5: Stock Level Response Time Distribution

5.5. Response Time versus Throughput Performance Curve

The performance curve for response times versus throughput (Clause 5.6.2) must be reported for the New-Order transaction. (8.1.6.5)

Figure 5.6: New Order Response Time versus Throughput

5.6. New Order Think Time Frequency Distribution Curve

Think Time frequency distribution curve (see Clause 5.6.3) must be reported for the New-Order transaction. (8.1.6.6)

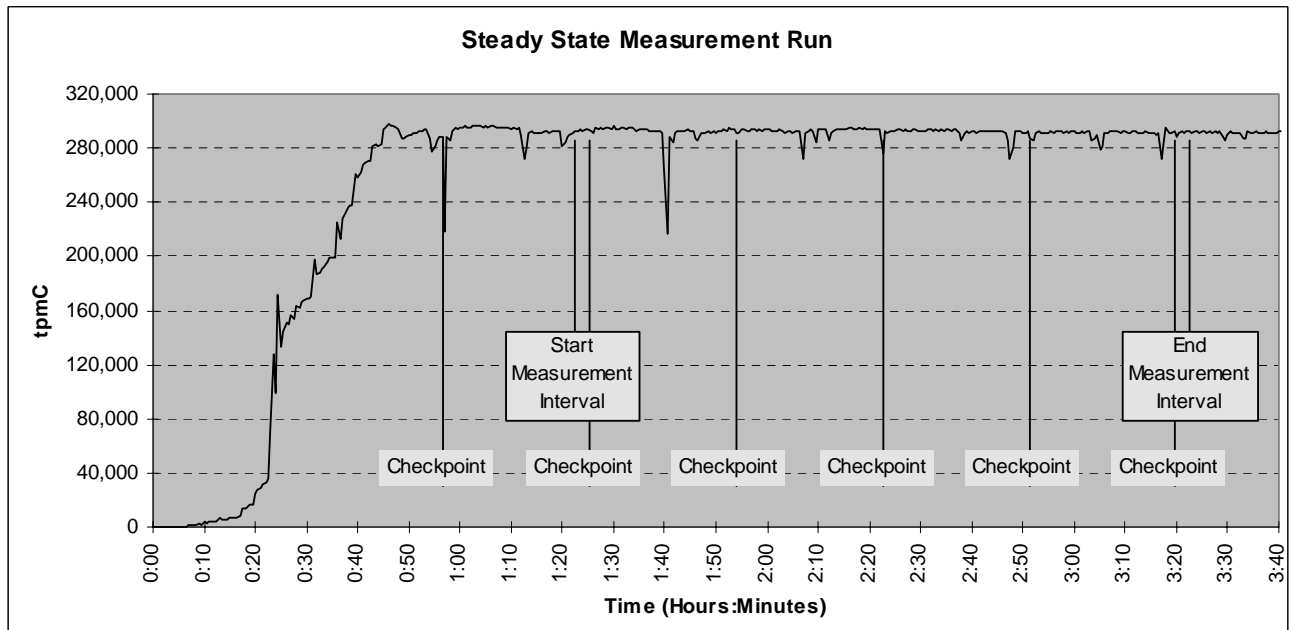

Figure 5.7: New Order Think Time Distribution

5.7. New-Order Throughput vs. Time

A graph of throughput versus elapsed time (Clause 5.6.4) must be reported for the New-Order transaction. (8.1.6.8)

Figure 5.8: Throughput (tpmC) versus Time

5.8. Determination of “Steady State”

The method used to determine that the SUT had reached a steady state prior to commencing the measurement interval (see Clause 5.5) must be described. (8.1.6.9)

The transaction throughput rate (tpmC) and response time were relatively constant after the initial ‘ramp up’ period. The throughput and response time behavior were determined by examining data reported for each 30-second interval over the duration of the benchmark. Ramp-up and steady state are discernible in the graph presented in Figure 5.8.

5.9. Work Performed During Steady State

A description of how the work normally performed during a sustained test (for example checkpointing, writing redo/undo log records, etc.) actually occurred during the measurement interval must be reported. (8.1.6.10)

The RTE selects a transaction type from the menu and prepares to request the appropriate blank form. A timestamp is taken before the form request is sent and after the response is returned. The difference between the two is saved off as the menu response time. The RTE then generates input data for the transaction to create a completed form and waits the appropriate key time. A timestamp is taken before the completed form is sent and after the response is returned. The difference between these two is saved off as the transaction response time. Both response times are padded with a 0.1 second delay per spec to account for the web browser delay. The appropriate transaction data and response times are logged and the RTE waits the required think time interval before repeating the process. Each RTE driver maintains its own log file. Log file contents are consolidated for the reports.

The RTE emulates web browsers (not terminals) in this client-server implementation. The RTE sends and receives HTML formatted data using HTTP through Ethernet LANs to a client application running on the client machine. The client application processes the request, sends the transaction to a COM+ component, waits for the transaction response, and returns an appropriately formatted HTML form back to the (emulated) web browser (RTE). When activated, the COM+ component invokes the Oracle 10g database server, collects the response, and returns the result to the requestor.

To perform checkpoints at specific intervals, the TPCC database log was sized so that log switches could occur at the desired checkpoint interval. Oracle then recorded the start and end of each checkpoint.

At each checkpoint, the Oracle database wrote to disk all database pages in memory that had been updated but not yet physically written to the disk.

5.10. Measurement Interval Duration

A statement of the duration of the measurement interval for the reported Maximum Qualified Throughput (tpmC) must be included. (8.1.6.12)

The measurement interval was 120 minutes.

5.11. Regulation of Transaction Mix

The method of regulation of the transaction mix (e.g. card decks or weighted random distribution) must be described. If weighted distribution is used and the RTE adjusts the weights associated with each transaction type, the maximum adjustments to the weight from the initial value must be disclosed. (8.1.6.13)

The RTE was given a weighed random distribution, which could not be adjusted during the run.

5.12. Transaction Statistics

The percentage of the total mix for each transaction type must be disclosed. (8.1.6.14)

The percentage of New-Order transactions rolled back as a result of invalid item number must be disclosed. (8.1.6.15)

The average number of order-lines entered per New-Order transaction must be disclosed. (8.1.6.16)

The percentage of remote order-lines entered per New-Order transaction must be disclosed. (8.1.6.17)

The percentage of remote Payment transactions must be disclosed. (8.1.6.18)

The percentage of customer selections by customer last name in the Payment and Order-Status transactions must be disclosed. (8.1.6.19)

The percentage of Delivery transactions skipped due to there being fewer than necessary orders in the New-Order table must be disclosed. (8.1.6.20)

Table 5.4 shows this information.

Table 5.4: Transaction Statistics

Transaction Type	Statistic	Value
New Order	Rolled back transactions	1.00%
	Home warehouse	99.00%
	Remote warehouse	1.00%
	Average Items per Order	10.00
Payment	Home warehouse	84.99%
	Remote warehouse	15.01%
	Non-primary key access	60.00%
Order Status	Non-primary key access	59.99%
Delivery	Skipped transactions (Interactive)	0
	Skipped transaction counts (Deferred)	0
	Skipped District counts (Deferred)	0
Transaction Mix	New Order	44.87%
	Payment	43.02%
	Order-Status	4.03%
	Delivery	4.03%
	Stock-Level	4.03%

5.13. Checkpoint Statistics

The number of checkpoints in the measurement interval, the time in seconds from the start of the measurement interval to the first checkpoint, and the Checkpoint Interval must be disclosed. (8.1.6.21)

There are four checkpoints in the measurement interval. The first checkpoint starts approximately 162 seconds into the measurement interval. The checkpoint interval is 29 minutes (from the start of one to the start of the next) and a checkpoint lasts approximately 25.9 minutes.

The start time and duration in seconds of at least the four (4) longest checkpoints during the Measurement Interval must be disclosed (see Clause 5.5.2.2 (2)). (8.1.6.11)

Table 5.5: Checkpoint Start Time and Duration

Item	Start	End	Duration
Measurement Interval	1:22:33	3:22:33	7200
1st Checkpoint	1:25:15	1:51:10	1555
2nd Checkpoint	1:53:54	2:19:50	1556
3rd Checkpoint	2:22:38	2:48:29	1551
4th Checkpoint	2:51:14	3:16:52	1538

6. Clause 6: SUT, Driver & Communications Definition

6.1. Remote Terminal Emulator (RTE) Description

The RTE input parameters, code fragments, functions, etc. used to generate each transaction input field must be disclosed. (8.1.7.1)

The RTE used is proprietary to Unisys. Appendix D contains the profile used as input to this RTE.

6.2. Loss of Terminal Connections

The number of terminal connections lost during the Measurement Interval must be disclosed (see Clause 6.6.2). (8.1.7.2)

One terminal connection was lost. The connection reconnected in one second.

6.3. Emulated Components

It must be demonstrated that the functionality and performance of the components being emulated in the Driver System are equivalent to that of the priced system. The results of the test described in Clause 6.6.3.4 must be disclosed. (8.1.7.3)

There were no emulated components in the benchmark configuration other than the emulated web browsers on the users' PCs.

6.4. Functional Diagrams

A complete functional diagram of both benchmark and the configuration of the proposed (target) system must be disclosed. A detailed list of all hardware and software functionality being performed on the Driver System and its interface to the SUT must be disclosed (see Clause 6.6.3.6). (8.1.7.4)

Section 0.7 describes and shows functional diagrams of the benchmarked and priced systems.

6.5. Network Configuration

The network configuration of both the tested and proposed (target) services which are being represented and a thorough explanation of exactly which parts are being replaced with the Driver System must be disclosed (see Clause 6.6.4). (8.1.7.5)

Figures 0.1 and 0.2 in Section 0.7 also diagram the network configurations of the benchmark and configured systems and represent the RTEs connected via LAN replacing the user PCs that are directly connected via LAN.

6.6. Network Bandwidth

The bandwidth of the network(s) used in the tested/priced configuration must be disclosed. (8.1.7.6)

Local area networks (LANs) are used in the priced and tested configurations. The database server contains one 1000 megabit-per-second Ethernet LAN adapter and is connected to each client through a 10/100/1000 megabit-per-second Ethernet switch. Each client contains two 10/100/1000 megabit-per-second inbuilt LAN controllers, one to connect to the database server and one to connect to the RTEs. A 10/100/1000 megabit-per-second switch was used to connect the clients to RTE driver systems emulating web browsers in the tested configuration. The 10/100/1000 LAN connections between the clients and switches run at 1000 megabits-per-second in the priced and tested configurations.

6.7. Operator Intervention

If the configuration requires operator intervention (see Clause 6.6.6), the mechanism and the frequency of this intervention must be disclosed. (8.1.7.7)

No operator intervention was required to sustain eight hours of operation at the reported throughput.

7.1. Pricing

A detailed list of hardware and software used in the priced system must be reported. Each separately orderable item must have vendor part number, description, and release/revision level, and either general availability status or committed delivery date. If package pricing is used, vendor part number of the package and a description uniquely identifying each of the components of the package must be disclosed. Pricing source(s) and effective date(s) must also be reported. (8.1.8.1)

The total 3-year price of the entire configuration must be reported, including: hardware, software, and maintenance charges. Separate component pricing is recommended. The basis of all discounts used must be disclosed. (8.1.8.2)

System pricing should include subtotals for the following components: Server Hardware, Server Software, Client Hardware, Client Software, and Network Components used for terminal connection (see Clause 7.2.2.3). Clause 6.1 describes the Server and Client components. (8.1.8.7)

System pricing must include line item indication where non-sponsoring companies' brands are used. System pricing must also include line item indication of third party pricing. (8.1.8.8)

A detailed list of hardware and software components along with their part numbers and prices is given in the Executive Summary near the beginning of this document.

7.1.1. System Pricing

Each priced configuration consists of an integrated system package, additional options, and components. Prices for all products are U.S. list prices.

7.1.2. Maintenance Pricing

Three-year support pricing for Unisys Corporation products is based on standard new product warranty, upgraded to provide 24 hours/day, 7 days/week support with four hour maximum response for hardware spare parts.

Oracle Corporation support pricing is based on 3 years support costs.

Microsoft support pricing is based on 3 years of annual support costs.

Server disks are covered by Computer Resolutions Inc.'s 3-year, return-to-factory warranty with seven-day maximum replenishment, and appropriate spares are included in the priced configuration.

7.1.3. Discounts

Computer Resolutions Inc. provides a standard large volume cash discount for the client, server and storage components of the priced configuration.

Oracle Corporation provides a Mandatory E-Business discount for the database software and support.

7.2. Availability

The committed delivery date for general availability (availability date) of products used in the price calculation must be reported. When the priced system includes products with different availability dates, the reported availability date for the priced system must be the date at which all components are committed to be available. (8.1.8.3)

The hardware, software and support/maintenance products priced in this benchmark are detailed on page v.

All components will be available by the date shown on page iv.

7.3. Measured tpmC, Pricing, Price/Performance, and Availability Date

A statement of the measured tpmC as well as the respective calculations for the 3-year pricing, price/performance (price/tpmC), and the availability date must be included. (8.1.8.4)

The measured tpmC, plus pricing calculations, price/performance, and availability are shown on pages v and vi.

7.4. Country-Specific Pricing

Additional Clause 7 related items might be included in the Full Disclosure Report for each country specific priced configuration. Country specific pricing is subject to Clause 7.1.7. (8.1.8.5)

None.

7.5. Usage Pricing

For any usage pricing, the sponsor must disclose: (8.1.8.6)

- *Usage level at which the component was priced.*
- *A statement of the company policy allowing such pricing.*

The component pricing based on usage is shown below:

- One (1) Microsoft Windows Server 2003, Datacenter Edition for 64-bit Itanium-based Systems license, 16 processor
- One (1) Oracle Database 10g Enterprise Edition license, 16 processor
- Eight (8) Microsoft Windows 2003 Server licenses
- One (1) Microsoft Visual C++ Standard license
- One (1) Unisys Storage Sentinel 20TB license

8.

Clause 8 : Full Disclosure Availability

8.1. Availability

The Full Disclosure Report must be readily available to the public at a reasonable charge, similar to charges for similar documents by that test sponsor. (8.2)

Copies of this Full Disclosure Report may be downloaded from the Transaction Processing Performance Council web site at www.tpc.org or obtained by contacting:

TPC Benchmark Administrator
Systems Analysis, Modeling & Measurement Group
Unisys Corporation, M/S 237
25725 Jeronimo Road
Mission Viejo, CA 92691
USA

9.1. Auditor's Report

The auditor's name, address, phone number and a copy of the auditor's attestation letter indicating compliance must be included in the Full Disclosure Report. (8.1.9.1)

A review of the pricing model is required to ensure that all components required are priced (see Clause 9.2.8). The auditor is not required to review the final Full Disclosure Report or the final pricing prior to issuing the attestations letter. (8.1.9.2)

Lorna Livingtree, a TPC certified auditor, audited this implementation of the TPC Benchmark C on the Unisys ES7000 Aries 420 Enterprise Server (16P) representing:

Performance Metrics, Inc.
137 Yankton St. Suite 101
Folsom, CA 95630

Phone: (916) 985-1131
Fax: (916) 985-1185
Email: Lorna@PerfMetrics.com

The attestation letter is shown on the next 2 pages.

PERFORMANCE METRICS INC.
TPC Certified Auditors

October 13, 2003

Jerrold Buggert
 Director of Modeling and Measurement
 Unisys Corporation
 25725 Jeronimo Road
 Mission Viejo, CA 92691

I have verified the TPC Benchmark™ C client/server for the following configuration:

Platform: Unisys ES7000 Aries 420 Enterprise Server
 Database Manager: Oracle Database 10g Enterprise Edition
 Operating System: Microsoft Windows Server 2003, Datacenter Edition for 64-bit Itanium-based Systems
 Transaction Manager: Microsoft COM+ (included in Windows 2003)

Server: Unisys ES7000 Aries 420 Enterprise Server				
CPU's	Memory	Disks	90% Response	TpmC
16 Intel Itanium 2 @ 1.5 GHz	Main: 128 GB Cache: 6 MB each	728 @ 18GB 26 @ 73GB 2 @ 36GB	0.96 sec	291,410.61
8 Clients: Unisys ES3020L Server (see Auditor Notes)				
2 Intel Xeon @ 2.4 GHz	Main: 2 GB Cache: 512KB	1 @ 18GB	Na	Na

In my opinion, these performance results were produced in compliance with the TPC requirements for the benchmark. The following attributes of the benchmark were given special attention:

- The transactions were correctly implemented.
- The database was properly sized and populated.
- The database was properly scaled with 24,000 warehouses, 23,500 of which were active during the Measured Interval.

PERFORMANCE METRICS INC.
TPC Certified Auditors

- The ACID properties were successfully demonstrated.
- The durability data loss and log loss tests were performed on the fully scaled database with 220,000 users and 22,000 active warehouses, running at over 10% load.
- Input data was generated according to the specified percentages.
- Eight hours of mirrored log space was configured on the measured system.
- Eight hours of dynamic table growth space was configured on the measured system.
- The 60-day space calculation was verified. The measured configuration has sufficient storage to satisfy this requirement.
- Measurement cycle times included a 0.1 second menu and a 0.1 second response time delays for emulated Web browsers.
- There were 235,000 user contexts present on the system.
- Each emulated user started with a different random number seed.
- The NURand constants used for database load and at run time were 0 and 85 respectively.
- The steady state portion of the test was 2 hours (7200 seconds).
- One checkpoint was taken before the measured interval and after steady state was reached.
- Four checkpoints were taken during the measured interval.
- The system pricing was checked for major components and maintenance.

Auditor Notes:

There were eight ES3020L clients in the measured configuration, seven older clients with dual 2.4GHz processors, 400MHz FSB, 2GB memory, one 18 GB 10Krpm drive, and one new client with dual 2.4GHz processors, 533MHz FSB, 2GB memory, one 18 GB 15Krpm drive. The pricing uses eight new ES3020L clients in the benchmark configuration, each with dual 2.4GHz processors, 533MHz FSB, 2GB memory and one 18 GB 15Krpm drive because the older measured clients are no longer orderable through Unisys. Performance and capacity of the substituted clients are the same or better than the measured clients. I believe that this substitution is compliant with current substitution rules - TAB Id 327.

Sincerely,

Lorna Livingtree
Auditor

DPBFSYNC.C

/* Copyright (c) Oracle Corporation 1993, 1992. All Rights Reserved. */

```

/*
NAME      DPBFSYNC.C

```

```

DESCRIPTION

```

```

  Flush o/s buffers to disk for a file.

```

```

  Calling fclose() or fflush() is not enough. These calls will only
flush

```

the buffer in the FILE structure by making a write() call to the o/s, and the o/s will probably place these data in its own disk buffers. dpbfsync() will cause the o/s disk buffers for a file to be written to disk.

This function should normally be called *after* an fflush() is done, or you will miss the data that is buffered in the FILE structure.

Windows Datacenter Server Configuration Information

System Information report written at: 10/10/03 12:54:51
System Name: MV-CASSIN8
[System Summary]

```

Item      Value
OS Name   Microsoft(R) Windows(R) Server 2003, Datacenter Edition
Version   5.2.3790 Build 3790
OS Manufacturer      Microsoft Corporation
System Name           MV-CASSIN8
System Manufacturer   UNISYS
System Model          ES7000/130
System Type           Itanium (TM) -based System
Processor             ia64 Family 31 Model 1 Stepping 5 GenuineIntel ~1500 Mhz

Processor             ia64 Family 31 Model 1 Stepping 5 GenuineIntel ~1500 Mhz
Processor             ia64 Family 31 Model 1 Stepping 5 GenuineIntel ~1500 Mhz
Processor             ia64 Family 31 Model 1 Stepping 5 GenuineIntel ~1500 Mhz
Processor             ia64 Family 31 Model 1 Stepping 5 GenuineIntel ~1500 Mhz
Processor             ia64 Family 31 Model 1 Stepping 5 GenuineIntel ~1500 Mhz
Processor             ia64 Family 31 Model 1 Stepping 5 GenuineIntel ~1500 Mhz
Processor             ia64 Family 31 Model 1 Stepping 5 GenuineIntel ~1500 Mhz
Processor             ia64 Family 31 Model 1 Stepping 5 GenuineIntel ~1500 Mhz
Processor             ia64 Family 31 Model 1 Stepping 5 GenuineIntel ~1500 Mhz
Processor             ia64 Family 31 Model 1 Stepping 5 GenuineIntel ~1500 Mhz
Processor             ia64 Family 31 Model 1 Stepping 5 GenuineIntel ~1500 Mhz

```

```

Processor             ia64 Family 31 Model 1 Stepping 5 GenuineIntel ~1500 Mhz
Processor             ia64 Family 31 Model 1 Stepping 5 GenuineIntel ~1500 Mhz
Processor             ia64 Family 31 Model 1 Stepping 5 GenuineIntel ~1500 Mhz
Processor             ia64 Family 31 Model 1 Stepping 5 GenuineIntel ~1500 Mhz
Processor             ia64 Family 31 Model 1 Stepping 5 GenuineIntel ~1500 Mhz

Windows 2003 IP Configuration Information

(Common to 8 clients except for Host Name, Physical Address, and IP Address)

Windows IP Configuration

Host Name : cmpcl01
Primary Dns Suffix :
Node Type : Unknown
IP Routing Enabled. : No
WINS Proxy Enabled. : No

Ethernet adapter Admin:

Connection-specific DNS Suffix . . :
Description : Intel(R) PRO/100+ Server Adapter
(PILA8470B)
Physical Address. : 00-D0-B7-3C-DD-DF
DHCP Enabled. : No
IP Address. : 192.158.2.1
Subnet Mask : 255.255.255.0
Default Gateway :
NetBIOS over Tcpip. : Disabled

Ethernet adapter DBMS:

Connection-specific DNS Suffix . . :
Description : Broadcom NetXtreme Gigabit Ethernet
Physical Address. : 00-06-5B-FE-80-97

DHCP Enabled. : No
IP Address. : 192.158.91.1
Subnet Mask : 255.255.255.0
Default Gateway :
NetBIOS over Tcpi. : Disabled

Ethernet adapter RTE:

Connection-specific DNS Suffix . . :
Description : Broadcom NetXtreme Gigabit Ethernet #2
Physical Address. : 00-06-5B-FE-80-98
DHCP Enabled. : No
IP Address. : 192.1.1.11
Subnet Mask : 255.255.255.0
Default Gateway :
NetBIOS over Tcpi. : Disabled

Mr. Weeks:

Here is the information you requested regarding pricing for several Microsoft products to be used in conjunction with your TPC-C benchmark testing.

All pricing shown is in US Dollars (\$).

Part Number	Description	Unit Price	Quantity	Price
P73-00295	Windows Server 2003, Standard Edition <i>Server license only - No CALs</i> <i>Discount Schedule: Open Program - No Level</i> <i>Unit Price reflects a 26% discount from the retail unit price of \$999.</i>	\$738	8	\$5,904
254-00170	Visual C++ Standard <i>No discounts applied</i>	\$109	1	\$109
PRO-PRORS-16U-01	Database Server Support Package <i>1 Year Term</i>	\$1,950	3	\$5,850

All products are currently orderable through Microsoft's normal distribution channels.

This quote is valid for the next 90 days.

If we can be of any further assistance, please contact Jamie Reding at (425) 703-0510 or jamiere@microsoft.com.

Reference ID: PCglwe0414019030

Please include this Reference ID in any correspondence regarding this price quote.

Multimode Duplex Fiber Optic Jumper Cables

GCFAZLL

LC to LC - Multimode Duplex Fiber Optic Patch Cable. LC cables are available in 50µ and 62.5µ (62.5 is Standard) and in *any cable length*.

The LC fiber optic connector interface is based on a 1.25mm ceramic ferrule and the familiar latching mechanism of the RJ-45 modular plug and jack. The LC connector is a small-form-factor connector that offers a port density equal to the modular jack.

Standard Length Cables						Add to Cart
Part #	Cable Length	Unit Price	5-9 20% Off	10-19 25% Off	20 or more 30% Off
