TPC Benchmark™ H  
Full Disclosure Report  
for  
HP ProLiant ML570G4  
using  
Microsoft SQL Server 2005 Enterprise x64 Edition SP1  
and  
Windows Server 2003 Enterprise x64 Edition SP1

---

**First Edition**  
**May 2006**

First Edition – May, 2006

Hewlett-Packard Company (HP), the Sponsor of this benchmark test, believes that the information in this document is accurate as of the publication date. The information in this document is subject to change without notice. The Sponsor assumes no responsibility for any errors that may appear in this document.

The pricing information in this document is believed to accurately reflect the current prices as of the publication date. However, the Sponsor provides no warranty of the pricing information in this document.

Benchmark results are highly dependent upon workload, specific application requirements, and system design and implementation. Relative system performance will vary as a result of these and other factors. Therefore, the TPC Benchmark H should not be used as a substitute for a specific customer application benchmark when critical capacity planning and/or product evaluation decisions are contemplated.

All performance data contained in this report was obtained in a rigorously controlled environment. Results obtained in other operating environments may vary significantly. No warranty of system performance or price/performance is expressed or implied in this report.

# Abstract

## Overview

This report documents the methodology and results of the TPC Benchmark™ H test conducted on the HP ProLiant ML570G4 using Microsoft SQL Server 2005 Enterprise x64 Edition SP1, in conformance with the requirements of the TPC Benchmark™ H Standard Specification, Revision 2.3.0. The operating system used for the benchmark was Microsoft Windows 2003 Enterprise x64 Edition SP1.

The benchmark results are summarized in the following table.

Hardware	Software	Total System Cost	QppH @ 100GB	QthH @ 100GB	QphH @ 100GB	\$/ QphH @ 100GB
HP ProLiant ML570G4	Microsoft SQL Server 2005 Enterprise x64 Edition SP1, Windows Server 2003, Enterprise x64 Edition SP1	\$154,937	19497.0	10404.6	14242.8	\$10.88

The TPC Benchmark™ H was developed by the Transaction Processing Performance Council (TPC). The TPC was founded to define transaction processing benchmarks and to disseminate objective, verifiable performance data to the industry.

## Standard and Executive Summary Statements

Pages ii-iv contains the Executive Summary and Numerical Quantities Summary of the benchmark results for the HP ProLiant ML570G4.

## Auditor

The benchmark configuration, environment and methodology used to produce and validate the test results, and the pricing model used to calculate the cost per QppH and QthH were audited by Lorna Livingtree of Performance Metrics, Inc. to verify compliance with the relevant TPC specifications. The auditor's letter of attestation is attached in Section 9.1 "Auditors' Report."

# 1.0 General Items

---

## 1.1 Test Sponsor

*A statement identifying the benchmark sponsor(s) and other participating companies must be provided.*

This benchmark was sponsored by Hewlett-Packard Company. The benchmark was developed and engineered by Hewlett-Packard Company. Testing took place at HP benchmarking laboratories in Houston, Texas.

## 1.2 Parameter Settings

*Settings must be provided for all customer-tunable parameters and options which have been changed from the defaults found in actual products, including by not limited to:*

- *Database Tuning Options*
- *Optimizer/Query execution options*
- *Query processing tool/language configuration parameters*
- *Recovery/commit options*
- *Consistency/locking options*
- *Operating system and configuration parameters*
- *Configuration parameters and options for any other software component incorporated into the pricing structure*
- *Compiler optimization options*

*This requirement can be satisfied by providing a full list of all parameters and options, as long as all those which have been modified from their default values have been clearly identified and these parameters and options are only set once.*

Appendix A, "Tunable Parameters," contains a list of all database parameters and operating system parameters.

## 1.3 Configuration Items

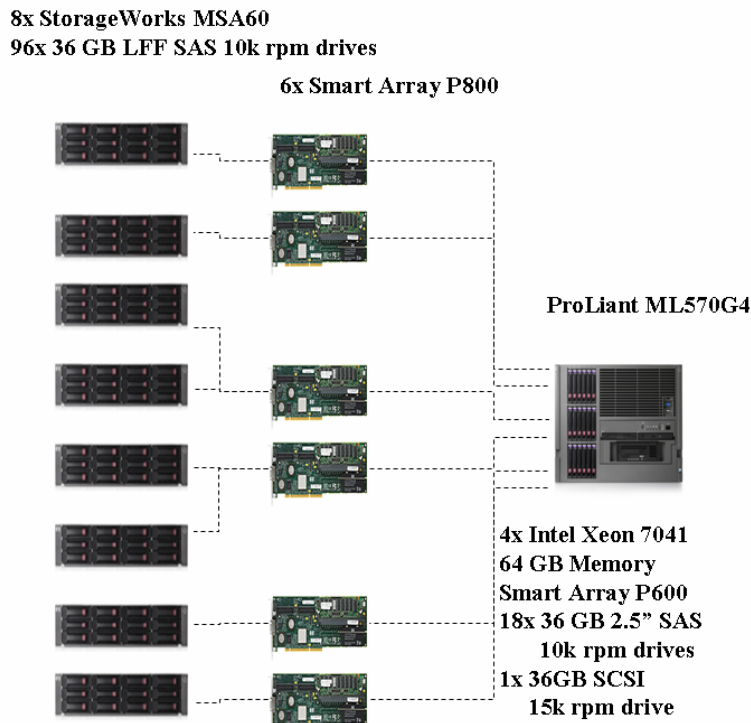

*Diagrams of both measured and priced configurations must be provided, accompanied by a description of the differences. This includes, but is not limited to:*

- *Number and type of processors*
- *Size of allocated memory, and any specific mapping/partitioning of memory unique to the test.*
- *Number and type of disk units (and controllers, if applicable).*
- *Number of channels or bus connections to disk units, including their protocol type.*
- *Number of LAN (e.g. Ethernet) Connections, including routers, workstations, terminals, etc., that were physically used in the test or are incorporated into the pricing structure.*
- *Type and the run-time execution location of software components (e.g., DBMS, query processing tools/languages, middle-ware components, software drivers, etc.).*

The server System Under Test (SUT), a HP ProLiant ML570G4 , depicted in Figure 1.1, consisted of :

- 4x Intel Xeon 7041 3.0GHz dual core with 2x2 MB L2 Cache
- 64 GB of memory
- 6 x HP Smart Array P800 Controllers
- 1 x HP Smart Array P600 Controllers
- 8 x HP StorageWorks MSA60 Enclosures
- 96 x 36GB Pluggable SAS 3.5" 15k rpm drives
- 18 x 36GB Pluggable SAS 2.5" 10K rpm drives
- 1 x 36GB Non-Pluggable SCSI 3.5" 15K rpm drive

**Figure 1.1 Benchmarked & Priced configuration**

# 2.0 Clause 1: Logical Database Design

---

## 2.1 Table Definitions

*Listings must be provided for all table definition statements and all other statements used to set up the test and qualification databases. (8.1.2.1)*

Appendix B, "Database Build Scripts," contains the table definitions and the program used to load the database.

## 2.2 Physical Organization of Database

*The physical organization of tables and indices, within the test and qualification databases, must be disclosed. If the column ordering of any table is different from that specified in Clause 1.4, it must be noted.*

Appendix B, "Database Build Scripts," contains the DDL for the index definitions.

## 2.3 Horizontal Partitioning

*Horizontal partitioning of tables and rows in the test and qualification databases (see Clause 1.5.4) must be disclosed.*

Horizontal partitioning was not used

## 2.4 Replication

*Any replication of physical objects must be disclosed and must conform to the requirements of Clause 1.5.6.*

No replication was used.

## 3.0 Clause 2: Queries and Refresh Functions Related Items

---

### 3.1 Query Language

*The query language used to implement the queries must be identified.*

SQL was the query language used.

### 3.2 Random Number Generation

*The method of verification for the random number generation must be described unless the supplied DBGEN and QGEN were used.*

The TPC-supplied DBGEN version 2.3.0 and QGEN version 2.3.0 were used to generate all database populations.

### 3.3 Substitution Parameters Generation

*The method used to generate values for substitution parameters must be disclosed. If QGEN is not used for this purpose, then the source code of any non-commercial tool used must be disclosed. If QGEN is used, the version number, release number, modification number and patch level of QGEN must be disclosed.*

The supplied QGEN version 2.3.0 was used to generate the substitution parameters.

### 3.4 Query Text and Output Data from Database

*The executable query text used for query validation must be disclosed along with the corresponding output data generated during the execution of the query text against the qualification database. If minor modifications (see Clause 2.2.3) have been applied to any functional query definitions or approved variants in order to obtain executable query text, these modifications must be disclosed and justified. The justification for a particular minor query modification can apply collectively to all queries for which it has been used. The output data for the power and throughput tests must be made available electronically upon request..*

Appendix C contains the query text and query output. The following modifications were used:

- In Q1, Q4, Q5, Q6, Q10, Q12, Q14, Q15 and Q20, the “dateadd” function is used to perform date arithmetic.
- In Q7, Q8 and Q9, the “datepart” function is used to extract part of a date (e.g., “YY”).
- In Q2, Q3, Q10, Q18 and Q21, the “top” function is used to restrict the number of output rows.
- The word GO is used as a command delimiter.

### 3.5 Query Substitution Parameters and Seeds Used

*All the query substitution parameters used during the performance test must be disclosed in tabular format, along with the seeds used to generate these parameters.*

Appendix D contains the seed and query substitution parameters used.

### **3.6 Isolation Level**

*The isolation level used to run the queries must be disclosed. If the isolation level does not map closely to one of the isolation levels defined in Clause 3.4, additional descriptive detail must be provided.*

The queries and transactions were run with isolation level 1.

### **3.7 Refresh Functions**

*The details of how the refresh functions were implemented must be disclosed (including source code of any non-commercial program used).*

Appendix E contains the source code for the refresh functions.

# 4.0 Clause 3: Database System Properties

## 4.1 Atomicity Requirements

*The results of the ACID tests must be disclosed along with a description of how the ACID requirements were met. This includes disclosing the code written to implement the ACID Transaction and Query.*

All ACID tests were conducted according to specification. The Atomicity, Isolation, Consistency and Durability tests were performed on the HP ProLiant ML570G4.

### 4.1.1 Atomicity of the Completed Transactions

*Perform the ACID Transaction for a randomly selected set of input data and verify that the appropriate rows have been changed in the ORDER, LINEITEM, and HISTORY tables.*

The following steps were performed to verify the Atomicity of completed transactions.

1. The total price from the ORDER table and the extended price from the LINEITEM table were retrieved for a randomly selected order key.
2. The ACID Transaction was performed using the order key from step 1.
3. The ACID Transaction committed.
4. The total price from the ORDER table and the extended price from the LINEITEM table were retrieved for the same order key. It was verified that the appropriate rows had been changed.

### 4.1.2 Atomicity of Aborted Transactions

*Perform the ACID transaction for a randomly selected set of input data, submitting a ROLLBACK of the transaction for the COMMIT of the transaction. Verify that the appropriate rows have not been changed in the ORDER, LINEITEM, and HISTORY tables.*

The following steps were performed to verify the Atomicity of the aborted ACID transaction:

1. The total price from the ORDER table and the extended price from the LINEITEM table were retrieved for a randomly selected order key.
2. The ACID Transaction was performed using the order key from step 1. The transaction was stopped prior to the commit.
3. The ACID Transaction was ROLLED BACK. .
4. The total price from the ORDER table and the extended price from the LINEITEM table were retrieved for the same order key used in steps 1 and 2. It was verified that the appropriate rows had not been changed.

## 4.2 Consistency Requirements

*Consistency is the property of the application that requires any execution of transactions to take the database from one consistent state to another.*

*A consistent state for the TPC-H database is defined to exist when:*

$$O\_TOTALPRICE = SUM(L\_EXTENDEDPRICE - L\_DISCOUNT) * (1 + L\_TAX)$$
*For each ORDER and LINEITEM defined by (O\_ORDERKEY = L\_ORDERKEY)*

### 4.2.1 Consistency Tests

*Verify that ORDER and LINEITEM tables are initially consistent as defined in Clause 3.3.2.1, based upon a random sample of at least 10 distinct values of O\_ORDERKEY.*

The following steps were performed to verify consistency:

1. The consistency of the ORDER and LINEITEM tables was verified based on a sample of O\_ORDERKEYs.

2. One hundred ACID Transactions were submitted from each of six execution streams.
3. The consistency of the ORDER and LINEITEM tables was reverified.

## 4.3 Isolation Requirements

*Operations of concurrent transactions must yield results which are indistinguishable from the results which would be obtained by forcing each transaction to be serially executed to completion in some order.*

### 4.3.1 Isolation Test 1 - Read-Write Conflict with Commit

*Demonstrate isolation for the read-write conflict of a read-write transaction and a read-only transaction when the read-write transaction is committed.*

The following steps were performed to satisfy the test of isolation for a read-only and a read-write committed transaction:

1. An ACID Transaction was started for a randomly selected O\_KEY, L\_KEY and DELTA. The ACID Transaction was suspended prior to Commit.
2. An ACID query was started for the same O\_KEY used in step 1. The ACID query blocked and did not see any uncommitted changes made by the ACID Transaction.
3. The ACID Transaction was resumed and committed.
4. The ACID query completed. It returned the data as committed by the ACID Transaction.

### 4.3.2 Isolation Test 2 - Read-Write Conflict with Rollback

*Demonstrate isolation for the read-write conflict of a read-write transaction and a read-only transaction when the read-write transaction is rolled back.*

The following steps were performed to satisfy the test of isolation for read-only and a rolled back read-write transaction:

1. An ACID transaction was started for a randomly selected O\_KEY, L\_KEY and DELTA. The ACID Transaction was suspended prior to Rollback.
2. An ACID query was started for the same O\_KEY used in step 1. The ACID query did not see any uncommitted changes made by the ACID Transaction.
3. The ACID Transaction was ROLLED BACK.
4. The ACID query completed.

### 4.3.3 Isolation Test 3 - Write-Write Conflict with Commit

*Demonstrate isolation for the write-write conflict of two update transactions when the first transaction is committed.*

The following steps were performed to verify isolation of two update transactions:

1. An ACID Transaction T1 was started for a randomly selected O\_KEY, L\_KEY and DELTA. The ACID transaction T1 was suspended prior to Commit.
2. Another ACID Transaction T2 was started using the same O\_KEY and L\_KEY and a randomly selected DELTA.
3. T2 waited.
4. The ACID transaction T1 was allowed to Commit and T2 completed.
5. It was verified that:

$$T2.L\_EXTENDEDPRICE = T1.L\_EXTENDEDPRICE + (DELTA1*(T1.L\_EXTENDEDPRICE/T1.L\_QUANTITY))$$

### 4.3.4 Isolation Test 4 - Write-Write Conflict with Rollback

*Demonstrate isolation for the write-write conflict of two update transactions when the first transaction is rolled back.*

The following steps were performed to verify the isolation of two update transactions after the first one is rolled back:

1. An ACID Transaction T1 was started for a randomly selected O\_KEY, L\_KEY and DELTA. The ACID Transaction T1 was suspended prior to Rollback.
2. Another ACID Transaction T2 was started using the same O\_KEY and L\_KEY used in step 1 and a randomly selected DELTA.
3. T2 waited.
4. T1 was allowed to ROLLBACK and T2 completed.
5. It was verified that T2.L\_EXTENDEDPRICE = T1.L\_EXTENDEDPRICE.

#### 4.3.5 Isolation Test 5 – Concurrent Read and Write Transactions on Different Tables

*Demonstrate the ability of read and write transactions affecting different database tables to make progress concurrently.*

The following steps were performed:

1. An ACID Transaction T1 for a randomly selected O\_KEY, L\_KEY and DELTA. The ACID Transaction T1 was suspended prior to Commit.
2. Another ACID Transaction T2 was started using random values for PS\_PARTKEY and PS\_SUPPKEY.
3. T2 completed.
4. T1 completed and the appropriate rows in the ORDER, LINEITEM and HISTORY tables were changed.

#### 4.3.6 Isolation Test 6 – Update Transactions During Continuous Read-Only Query Stream

*Demonstrate the continuous submission of arbitrary (read-only) queries against one or more tables of the database does not indefinitely delay update transactions affecting those tables from making progress.*

The following steps were performed:

1. An ACID Transaction T1 was started, executing Q1 against the qualification database. The substitution parameter was chosen from the interval [0..2159] so that the query ran for a sufficient amount of time.
2. Before T1 completed, an ACID Transaction T2 was started using randomly selected values of O\_KEY, L\_KEY and DELTA.
3. T2 completed before T1 completed.
4. It was verified that the appropriate rows in the ORDER, LINEITEM and HISTORY tables were changed.

## 4.4 Durability Requirements

*The tested system must guarantee durability: the ability to preserve the effects of committed transactions and insure database consistency after recovery from any one of the failures listed in Clause 3.5.2.*

### 4.4.1 Permanent Unrecoverable Failure of Any Durable Medium and Loss of System Power

*Guarantee the database and committed updates are preserved across a permanent irrecoverable failure of any single durable medium containing TPC-H database tables or recovery log tables.*

The database log was stored on a RAID-1 protected array of two physical drives. The tables for the database were stored on 8 RAID-0 arrays each containing 10 physical drives. A backup of the database was taken. The backup was spread across 8 RAID-1 arrays.

The tests were conducted on the qualification database. The steps performed are shown below:

1. The complete database was backed up.
2. Six streams of ACID transactions were started. Each stream executed a minimum of 100 transactions.
3. While the test was running, one of the disks from the database RAID-1 log was removed.
4. After it was determined that the test would still run with the loss of a log disk, one physical drive of a RAID-0 data volume was removed.
5. A checkpoint was issued to force a failure.
6. The six streams of ACID transactions failed and recorded their number of committed transaction in success files.
7. The database log was dumped to disk.
8. The database and log disks were replaced with new disks and RAID rebuild process started

9. When log RAID rebuild process finished a database restore was done.
10. A command was issued causing the database to run through its roll-forward recovery.
11. The counts in the success files and the HISTORY table count were compared and were found to match.

#### **4.4.2 System Crash**

*Guarantee the database and committed updates are preserved across an instantaneous interruption (system crash/system hang) in processing which requires the system to reboot to recover.*

1. Six streams of ACID transactions were started. Each stream executed a minimum of 100 transactions.
2. While the streams of ACID transactions were running, the system was powered off.
3. When power was restored, the system rebooted and the database was restarted.
4. The database went through a recovery period.
5. The success file and the HISTORY table counts were compared and were found to match.

#### **4.4.3 Memory Failure**

*Guarantee the database and committed updates are preserved across failure of all or part of memory (loss of contents).*

See section 4.4.2

# 5.0 Clause 4: Scaling and Database Population

## 5.1 Initial Cardinality of Tables

The cardinality (e.g., the number of rows) of each table of the test database, as it existed at the completion of the database load (see clause 4.2.5) must be disclosed.

Table 5.1 lists the TPC Benchmark H defined tables and the row count for each table as they existed upon completion of the build.

**Table 5.1: Initial Number of Rows**

Table Name	Row Count
Region	5
Nation	25
Supplier	1,000,000
Customer	15,000,000
Part	20,000,000
Partsupp	80,000,000
Orders	150,000,000
Lineitem	600,037,902

## 5.2 Distribution of Tables and Logs Across Media

The distribution of tables and logs across all media must be explicitly described for the tested and priced systems.

Microsoft SQL Server was configured on a HP ProLiant ML570G4 with the following configuration:

- 6 x Smart Array P800 disk controllers
- 1 x Smart Array P600 disk controller
- 6 x StorageWorks MSA60 Enclosures
- 96 x 36GB SAS 3.5" 15k rpm external disk drives
- 18 x 36GB SAS 2.5" 10k rpm internal disk drives
- 1 x 36GB SCSI 10k rpm internal disk drive

All 114 disks were used to hold table data, indexes, database log and the temporary database (TempDB).

A detailed description of distribution of database filegroups and log can be found in Table 5.2.1

**Table 5.2.1: SMART Array Controller Disk Array to Logical Drive Mapping**

SMART Array Controller	SMART Logical Drive Array Letter	Number of Physical Drives in SMART LDA	SMART Logical Drive Number	SMART Fault Tolerance	Disk Format	Size (MB)	Contents
Slot 4	A	2	1	RAID1	RAW	20000	TpchLog
			2	RAID1	RAW	10000	TempDBLog
			3	RAID1	RAW	500	Tpch1gbLog
Slot 4	B	16	1	RAID0	RAW	30000	Tpch100g
			2	RAID0	RAW	15000	TempDB
			3	RAID1	NTFS	100000	LoadFg
Slot 10	A	12	1	RAID0	RAW	30000	Tpch100g
			2	RAID0	RAW	15000	TempDB
			3	RAID1	NTFS	100000	LoadFg
Slot 5	A	12	1	RAID0	RAW	30000	Tpch100g
			2	RAID0	RAW	15000	TempDB
			3	RAID1	NTFS	100000	LoadFg
Slot 6	A	12	1	RAID0	RAW	30000	Tpch100g
			2	RAID0	RAW	15000	TempDB
			3	RAID1	NTFS	100000	LoadFg
			4	RAID0	RAW	2000	TempDB
Slot 7	A	12	1	RAID0	RAW	30000	Tpch100g
			2	RAID0	RAW	15000	TempDB
			3	RAID1	NTFS	100000	LoadFg
Slot 7	B	12	1	RAID0	RAW	30000	Tpch100g
			2	RAID0	RAW	15000	TempDB
Slot 8	A	12	1	RAID0	RAW	30000	Tpch100g
			2	RAID0	RAW	15000	TempDB
			3	RAID1	NTFS	100000	LoadFg
Slot 9	A	12	1	RAID0	RAW	30000	Tpch100g
			2	RAID0	RAW	15000	TempDB
			3	RAID1	NTFS	100000	LoadFg
Slot 9	B	12	1	RAID0	RAW	30000	Tpch100g
			2	RAID0	RAW	15000	TempDB
Slot 1					NTFS	36000	OS

### 5.3 Mapping of Database Partitions/Replications

*The mapping of database partitions/replications must be explicitly described.*

Database partitioning/replication was not used..

## 5.4 Implementation of RAID

*Implementations may use some form of RAID to ensure high availability. If used for data, auxiliary storage (e.g. indexes) or temporary space, the level of RAID used must be disclosed for each device.*

RAID 0 was used for database filegroups and tempdb, and RAID 1 for database recovery logs.

## 5.5 DBGEN Modifications

*The version number, release number, modification number, and patch level of DBGEN must be disclosed. Any modifications to the DBGEN (see Clause 4.2.1) source code must be disclosed. In the event that a program other than DBGEN was used to populate the database, it must be disclosed in its entirety.*

A modified DBGEN version 2.3.0 was used for database population. The modified version differs only in column order for output flatfile. The only modified file, Print.C, is included in Appendix F.1

## 5.6 Database Load time

*The database load time for the test database (see clause 4.3) must be disclosed.*

The database load time was 1 hour 30 minutes 37 seconds.

## 5.7 Data Storage Ratio

*The data storage ratio must be disclosed. It is computed by dividing the total data storage of the priced configuration (expressed in GB) by the size chosen for the test database as defined in 4.1.3.1. The ratio must be reported to the nearest 1/100<sup>th</sup>, rounded up.*

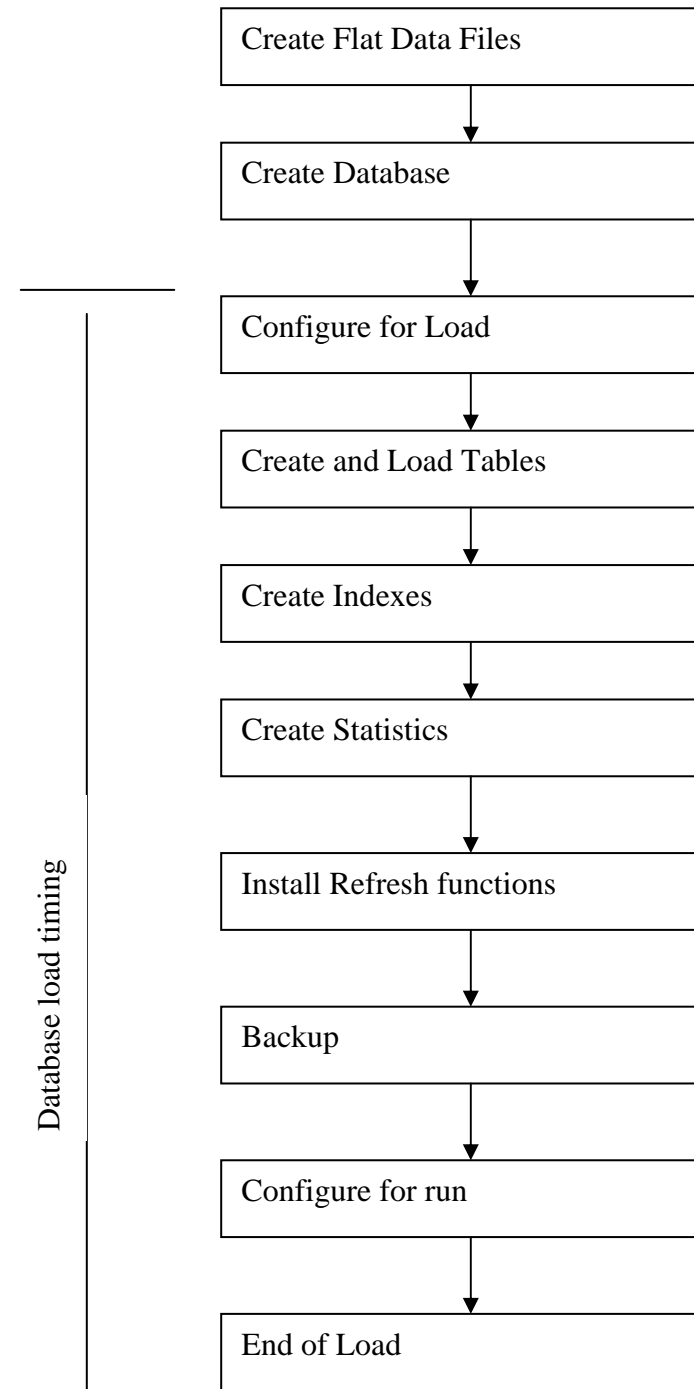

Disk Type	Number of Disks	Total Disk Space	Data Storage Ratio
36 GB	114	4014 GB	40.14

## 5.8 Database Load Mechanism Details and Illustration

*The details of the database load must be disclosed, including a block diagram illustrating the overall process. Disclosure of the load procedure includes all steps, scripts, input and configuration files required to completely reproduce the test and qualification databases.*

Flat files for each of the tables were created using DBGEN.  
The tables were loaded as depicted in Figure 5-8.

**Figure 5.8: Block Diagram of Database Load Process**

## ***6.0 Clause 5: Performance Metrics and Execution Rules Related Items***

### **6.1 Steps in the Power Test**

*The details of the steps followed to implement the power test (e.g., system boot, database restart, etc.) must be disclosed.*

The following steps were used to implement the power test:

1. The system was rebooted
2. RF1 Refresh Transaction
3. Stream 00 Execution
4. RF2 Refresh Transaction.

### **6.2 Timing Intervals for Each Query and Refresh Function**

*The timing intervals (see Clause 5.3.6) for each query of the measured set and for both refresh functions must be reported for the power test.*

The timing intervals for each query and both refresh functions are given in the Numerical Quantities Summary earlier in the executive summary.

### **6.3 Number of Streams for The Throughput Test**

*The number of execution streams used for the throughput test must be disclosed.*

Five streams were used for the Throughput Test.

### **6.4 Start and End Date/Times for Each Query Stream**

*The start time and finish time for each query execution stream must be reported for the throughput test.*

The Numerical Quantities Summary contains the start and stop times for the query execution streams run on the system reported.

### **6.5 Total Elapsed Time for the Measurement Interval**

*The total elapsed time of the measurement interval(see Clause 5.3.5) must be reported for the throughput test.*

The Numerical Quantities Summary contains the timing intervals for the throughput test run on the system reported.

### **6.6 Refresh Function Start Date/Time and Finish Date/Time**

*Start and finish time for each update function in the update stream must be reported for the throughput test.*

Stream ID	RF	Start Date	Start time	Stop Date	Stop Time
Stream00	RF1	5/4/2006	10:09:28	5/4/2006	10:10:02
Stream00	RF2	5/4/2006	10:22:43	5/4/2006	10:23:03
Stream01	RF1	5/4/2006	11:22:00	5/4/2006	11:22:27
Stream01	RF2	5/4/2006	11:22:27	5/4/2006	11:22:50
Stream02	RF1	5/4/2006	11:22:51	5/4/2006	11:23:20
Stream02	RF2	5/4/2006	11:23:21	5/4/2006	11:23:45
Stream03	RF1	5/4/2006	11:23:46	5/4/2006	11:24:13
Stream03	RF2	5/4/2006	11:24:14	5/4/2006	11:24:37
Stream04	RF1	5/4/2006	11:24:38	5/4/2006	11:25:08
Stream04	RF2	5/4/2006	11:25:09	5/4/2006	11:25:33
Stream05	RF1	5/4/2006	11:25:34	5/4/2006	11:26:02
Stream05	RF2	5/4/2006	11:26:02	5/4/2006	11:26:29

## 6.7 Timing Intervals for Each Query and Each Refresh Function for Each Stream

*The timing intervals (see Clause 5.3.6) for each query of each stream and for each update function must be reported for the throughput test.*

The timing intervals for each query and each update function are given in the Numerical Quantities Summary earlier in the executive summary.

## 6.8 Performance Metrics

*The computed performance metrics, related numerical quantities and the price performance metric must be reported.*

The Numerical Quantities Summary contains the performance metrics, related numerical quantities, and the price/performance metric for the system reported.

## 6.9 The Performance Metric and Numerical Quantities from Both Runs

*A description of the method used to determine the reproducibility of the measurement results must be reported. This must include the performance metrics (QppH and QthH) from the reproducibility runs.*

Performance results from the first two executions of the TPC-H benchmark indicated the following difference for the metric points:

Run	QppH @ 100GB	QthH @ 100GB	QphH @ 100GB
Run 1	19411.7	10612.1	14352.7
Run 2	19497.0	10404.6	14242.8

## 6.11 System Activity Between Tests

*Any activity on the SUT that takes place between the conclusion of Run1 and the beginning of Run2 must be disclosed.*

SQL Server was restarted between runs.

# 7.0 Clause 6: SUT and Driver Implementation Related Items

## 7.1 Driver

*A detailed description of how the driver performs its functions must be supplied, including any related source code or scripts. This description should allow an independent reconstruction of the driver.*

The TPC-H benchmark was implemented using a Microsoft tool called StepMaster. This tool consist of GUI tool that allows the configuration of steps and a run only version which was used to execute the load and runs. StepMaster is a general purpose test tool which can drive ODBC and shell commands. Within StepMaster, the user designs a workspace corresponding to the sequence of operations (or steps) to be executed. When the workspace is executed, StepMaster records information about the run into a database as well as a log file for later analysis.

StepMaster provides a mechanism for creating parallel streams of execution. This is used in the throughput tests to drive the query and refresh streams. Each step is timed using a millisecond resolution timer. A timestamp T1 is taken before beginning the operation and a timestamp T2 is taken after completing the operation. These times are recorded in a database as well as a log file for later analysis.

Two types of ODBC connections are supported. A dynamic connection is used to execute a single operation and is closed when the operation finishes. A static connection is held open until the run completes and may be used to execute more than one step. A connection (either static or dynamic) can only have one outstanding operation at any time.

In TPC-H, static connections are used for the query streams in the power and throughput tests. StepMaster reads an Access database to determine the sequence of steps to execute. These commands are represented as the Implementation Specific Layer. StepMaster records its execution history, including all timings, in the Access database. Additionally, StepMaster writes a textual log file of execution for each run.

The source code is disclosed on Appendix F

## 7.2 Implementation Specific Layer (ISL)

*If an implementation-specific layer is used, then a detailed description of how it performs its functions must be supplied, including any related source code or scripts. This description should allow an independent reconstruction of the implementation-specific layer.*

The StepMaster Runonly program is used to control and track the execution of queries, via commands stored in a Microsoft Access database. The source of this program is contained in Appendix F. The following steps are performed, to accomplish the Power and Throughput Runs:

### 1. Power Run

- Execute 16 concurrent RF1 threads, each of which will apply a segment of a refresh set generated by dbgen. Each thread submits multiple transactions, where a transaction spans a set of orders and their associated line items.
- Execute the Stream 0 queries in the order according to TPC Benchmark H Specification, Appendix A
- Execute 16 concurrent RF2 threads, each of which will apply a segment of a refresh set generated by dbgen. Each thread submits multiple transactions, where a transaction spans a set of orders and their associated line items.

### 2. Throughput Run

- Execute 5 concurrent query streams. Each stream executes queries in the order according to TPC Benchmark H Specification, Appendix A, for the appropriate Stream ID (01-07). Upon completion of each stream, a semaphore is set to indicate completion.
- Execute 5 consecutive RF1/RF2 transactions, against ascending Refresh sets produced by dbgen.

- The first RF1 waits on a semaphore prior to beginning its insert operations. Each step is timed by StepMaster. The timing information, together with an activity log, are stored for later analysis. The inputs and results of steps are stored in text files for later analysis.

### **7.3 Profile-Directed Optimization**

*If profile-directed optimization as described in Clause 5.2.9 is used, such used must be disclosed.*

Profile-directed optimization was not used.

# 8.0 Clause 7: Pricing Related Items

## 8.1 Hardware and Software Used

*A detailed list of hardware and software used in the priced system must be reported. Each item must have vendor part number, description, and release/revision level, and either general availability status or committed delivery date. If package-pricing is used, contents of the package must be disclosed. Pricing source(s) and effective date(s) of price(s) must also be reported.*

A detailed list of all hardware and software, including the 3-year price, is provided in the Executive Summary at the front of this report. The price quotations are included in Appendix G, at the end of this document.

## 8.2 Total 3 Year Price

*The total 3-year price of the entire configuration must be reported including: hardware, software, and maintenance charges. Separate component pricing is recommended. The basis of all discounts used must be disclosed.*

A detailed list of all hardware and software, including the 3-year price, is provided in the Executive Summary at the front of this report. The price quotations are included in Appendix G, at the end of this document. As a large purchase, this purchase qualifies for a 16% discount from Hewlett-Packard Company.

## 8.3 Availability Date

*The committed delivery date for general availability of products used in the price calculations must be reported. When the priced system includes products with different availability dates, the availability date reported on the executive summary must be the date by which all components are committed to being available. The full disclosure report must report availability dates individually for at least each of the categories for which a pricing subtotal must be provided.*

The HP ProLiant ML570G4, system memory, additional processors are available at the time of publication. Smart Array P800 controllers and StorageWorks MSA60 Enclosures will be generally available on or before November 22, 2006. All other hardware is generally available at the time of publication.

The system software, Microsoft Windows Server 2003, Enterprise x64 Edition SP1 and the database software, Microsoft SQL Server 2005 Enterprise x64 Edition SP1 are generally available at the time of publication.

## 8.4 Orderability Date

*For each of the components that are not orderable on the report date of the FDR, the following information must be included in the FDR:*

- Name and part number of the item that is not orderable*
- The date when the component can be ordered (on or before the Availability Date)*
- The method to be used to order the component (at or below the quoted price) when that date arrives*
- The method for verifying the price*

Some line item components used in this benchmark are not orderable at the time of this publication. These items will be orderable on or before the system Availability Date indicated as part of this submission. For specific information on these items regarding orderable dates and pricing verification, please see table in Appendix G.

## 8.5 Country-Specific Pricing

*Additional Clause 7 related items may be included in the Full Disclosure Report for each country-specific priced configuration. Country-specific pricing is subject to Clause 7.1.7.*

The configuration is priced for the United States of America.

# 9.0 Clause 9: Related Items

## 9.1 Auditors' Report

*The auditor's agency name, address, phone number, and Attestation letter with a brief audit summary report indicating compliance must be included in the full disclosure report. A statement should be included specifying who to contact in order to obtain further information regarding the audit process.*

This implementation of the TPC Benchmark H was audited by Lorna Livingtree of Performance Metrics. Further information regarding the audit process may be obtained from:

**PERFORMANCE METRICS INC.**  
**TPC Certified Auditors**

---

May 8, 2006

Mr. Daniel Pol  
Hewlett-Packard Company  
20555 SH 249  
Houston, TX 77077

I have verified by remote the TPC Benchmark™ H for the following configuration:

Platform: ProLiant ML570G4  
Database Manager: Microsoft SQL Server 2005 Enterprise Edition (SP1)  
Operating System: Windows Server 2003 Enterprise Edition (SP1)

CPU's	Memory	Total Disks	Qpph@ 100GB	<a href="#">QthH@100GB</a>	QphH@100GB
4 Intel @ 3.0 Ghz	64 GB	115 @ 36 GB	<b>19,497.0</b>	<b>10,404.6</b>	<b>14,242.8</b>

In my opinion, these performance results were produced in compliance with the TPC requirements for the benchmark. The following attributes of the benchmark were given special attention:

- The database tables were defined with the proper columns, layout and sizes.
- The tested database was correctly scaled and populated for 100GB using DBGEN. The version of DBGEN was 2.3.0.
- The qualification database layout was identical to the tested database except for the size of the files.
- The query text was verified to use only compliant variants and minor modifications.
- The executable query text was generated by QGEN and submitted through a standard interactive interface. The version of QGEN was 2.3.0.
- The validation of the query text against the qualification database produced compliant results.
- The refresh functions were properly implemented and executed the correct number of inserts and deletes.

**PERFORMANCE METRICS INC.**  
**TPC Certified Auditors**

---

- The load timing was properly measured and reported.
- The execution times were correctly measured and reported.
- The performance metrics were correctly computed and reported.
- The repeatability of the measurement was verified.
- The ACID properties were successfully demonstrated and verified.
- The system pricing was checked for major components and maintenance.
- The executive summary pages of the FDR were verified for accuracy.

Auditor's Notes: None

Sincerely,

Lorna Livingtree  
Auditor

# Appendix A: Tunable Parameters

- Note: These are the settings used during the power test. The settings altered for the load are documented in Appendix B.

## A.1 Microsoft SQL Server 2005 Version

The following text was output was generated by executing the select @@version command:

```
Microsoft SQL Server 2005 - 9.00.2047.00 (X64)
Apr 14 2006 01:11:53
Copyright (c) 1988-2005 Microsoft Corporation
Enterprise Edition (64-bit) on
Windows NT 5.2 (Build 3790: Service Pack 1)
```

## A.2 SQL Server 2005 Installation

The installation followed the default options. For the sort order Latin1\_General\_binary was chosen. Client tools and development tools were not installed on the server. Mixed mode authentication was used.

## A.3 SQL Server 2005 Startup Parameters

```
SQLSERVR -c -x -E -T834
-x Disable the Keeping of CPU time and cache-hit ratio statistics.
-c Start SQL Server independently of Windows NT Service
Control Manager
-E Increase the number of consecutive extents allocated per file to
4
-T834 Enable large page support
```

## A.4 Microsoft SQL Server 2005 Configuration Parameters

name	minimum	maximum	config_value	run_value
Ad Hoc Distributed Queries	0	1	0	0
affinity I/O mask	-2147483648	2147483647	0	0

## A.5 Windows 2003 Configuration

The default installation of Windows 2003 Enterprise Edition was used. All default options were selected during the install except:

- A TCP/IP address was configured on the system.

Updated installation to optimize performance for applications. (System Properties > Advanced > Performance Options > Programs)

Memory Address 0xFA000000-0xFD3FFFFF	Intel(R) 6700PXH	0x0000B000-0x0000BFFF	Smart Array P800 Controller	OK

 Tracks/Cylinder 255  
 Partition Disk #29, Partition #0  
 Partition Size 14.64 GB (15,718,154,240 bytes)  
 Partition Starting Offset 65,536 bytes

Description Disk drive  
 Manufacturer (Standard disk drives)  
 Model HP LOGICAL VOLUME SCSI Disk Device  
 Bytes/Sector 512

Media Loaded Yes  
 Media Type Fixed hard disk  
 Partitions 1  
 SCSI Bus 0  
 SCSI Logical Unit 0  
 SCSI Port 7  
 SCSI Target ID 4  
 Sectors/Track 63  
 Size 29.29 GB (31,453,470,720 bytes)  
 Total Cylinders 3,824  
 Total Sectors 61,432,560  
 Total Tracks 975,120  
 Tracks/Cylinder 255  
 Partition Disk #18, Partition #0  
 Partition Size 29.29 GB (31,455,182,848 bytes)  
 Partition Starting Offset 65,536 bytes

Description Disk drive  
 Manufacturer (Standard disk drives)  
 Model HP LOGICAL VOLUME SCSI Disk Device

two types of
    ' nodes -
    ' 1. Nodes that contain data for the workspace -
this could
    ' be data for the different types of steps or
parameters
    ' 2. Nodes that display static data - these kind
of nodes
    ' are referred to as label nodes e.g. "Global
Steps" is a
    ' label node
    ' This function returns True if the passed in key
corresponds
    ' to a label node

    IsLabel = InStr(strKey, mstrLabelPrefix) > 0

End Function

Function MakeKeyValid(lngIdentifier As Long, _
    intTypeOfNode As Integer, _
    Optional ByVal WorkspaceId As Long = 0, _
    Optional ByVal InstanceId As Long = 0) As String

    ' We use a numbering scheme while loading the
tree view with
    ' all node data, since it needs a unique key and
we want to
    ' use the key to identify the data it contains.
    ' Moreover, add a character to the beginning of
the identifier
    ' so that the tree view control accepts it as a
valid string,
    ' viz. "456" doesn't work, so change it to "W456"
    ' The general scheme is to concatenate a Label
with the Identifier
    ' e.g A Global Step Node will have the Label, G
and the Step Id
    ' concatenated to form the unique key
    ' The list of all such node types is given below
    ' 1. "W" + Workspace_Id for Workspace nodes
    ' 2. "P" + Parameter_Id for Parameter nodes
    ' 3. "M" + Step_Id for Manager Step nodes
    ' 4. "S" + Step_Id for Worker Step nodes
    ' 5. "G" + Step_Id for Global Step nodes
    ' 6. Instance_id + "I" + Step_Id for Instance
nodes
    ' 7. Workspace_id + "L" + the label identifier =
node type for all Label nodes
    ' Since the manager, worker and global steps are
stored in the
    ' same table and the step identifiers will always
be unique, we
    ' can use the same character as the prefix, but
this is a
    ' convenient way to know the type of step being
processed.

```

```

    ' The workspace id is appended to the label
identifier to make
    ' it unique, since multiple workspaces may be
open during a session
    ' Strip the prefix characters off while saving
the Ids to the db

'
' PURPOSE: This class executes the step that is
assigned to the ExecuteStep property. It executes the
pre-execution constraints
' in sequence and then the step itself.
At the end it executes
' the post-execution constraints. Since
these steps should always
' be executed in sequence, each step is
only fired on the
' completion of the previous step.

Hewlett-Packard  
 Company  
 Daniel Pol  
 20555 SH 249  
 Houston, TX 77070

Mr. Pol:

Here is the information you requested regarding pricing for several Microsoft products to be used in conjunction with your TPC-H benchmark testing.

All pricing shown is in US Dollars (\$).

Part Number	Description	Unit Price	Quantity	Price
810-04793	<b>SQL Server 2005 Enterprise x64 Edition</b> <i>Server License with 25 CALs</i> <i>Discount Schedule: Open Program - No Level</i> <i>Unit Price reflects a 39% discount from the retail unit price of \$13,969.</i>	\$8,487	1	\$8,487
359-01911	<b>SQL Server 2005 Client License</b> <i>Discount Schedule: Open Program - No Level</i> <i>Unit Price reflects a 4% discount from the retail unit price of \$163.</i>	\$156	25	\$3,900
P72-00274	<b>Windows Server 2003 Enterprise x64 Edition</b> <i>Server License Only - No CALs</i> <i>Discount Schedule: Open Program - No Level</i> <i>Unit Price reflects a 42% discount from the retail unit price of \$3,999.</i>	\$2,334	1	\$2,334
254-00170	<b>Visual C++ Standard Edition</b> <i>No Discounts Applied</i>	\$109	1	\$109
046-00856	<b>Visual Basic 2003 .Net Professional</b> <i>No Discounts Applied</i>	\$109	1	\$109
N/A	<b>Microsoft Problem Resolution Services</b> <i>Professional Support</i> <i>(1 Incident)</i>	\$245	1	\$245

All products are currently orderable through Microsoft's normal distribution channels.

Some products may not be currently orderable but will be available through Microsoft's normal distribution channels by November 7, 2005.
