

Energy Efficiency Metrics From an EPA Energy Star and EU Code of Conduct Perspective

Liam Newcombe
BCS Data Centre Specialist Group Secretary
EU CoC Data Centres – Chair, Best Practice Working Group

Energy Benchmarks

Goals of Benchmarks

Types of Benchmark

Generalised Benchmarks

Standard energy reporting

Next phase

Goals

- EU CoC - “Select efficient hardware”
- EU CoC - “Select efficient software”
- Drive improvements by enhancing competition
- Improve market efficiency

Energy Benchmarks

Goals of Benchmarks

Types of Benchmark

Generalised Benchmarks

Standard energy reporting

Next phase

Maximum performance

- A broad range of benchmarks which effectively;
 - Test peak *available* performance
 - Test hardware and software
- Performance per capital \$ / £ / €

Maximum performance

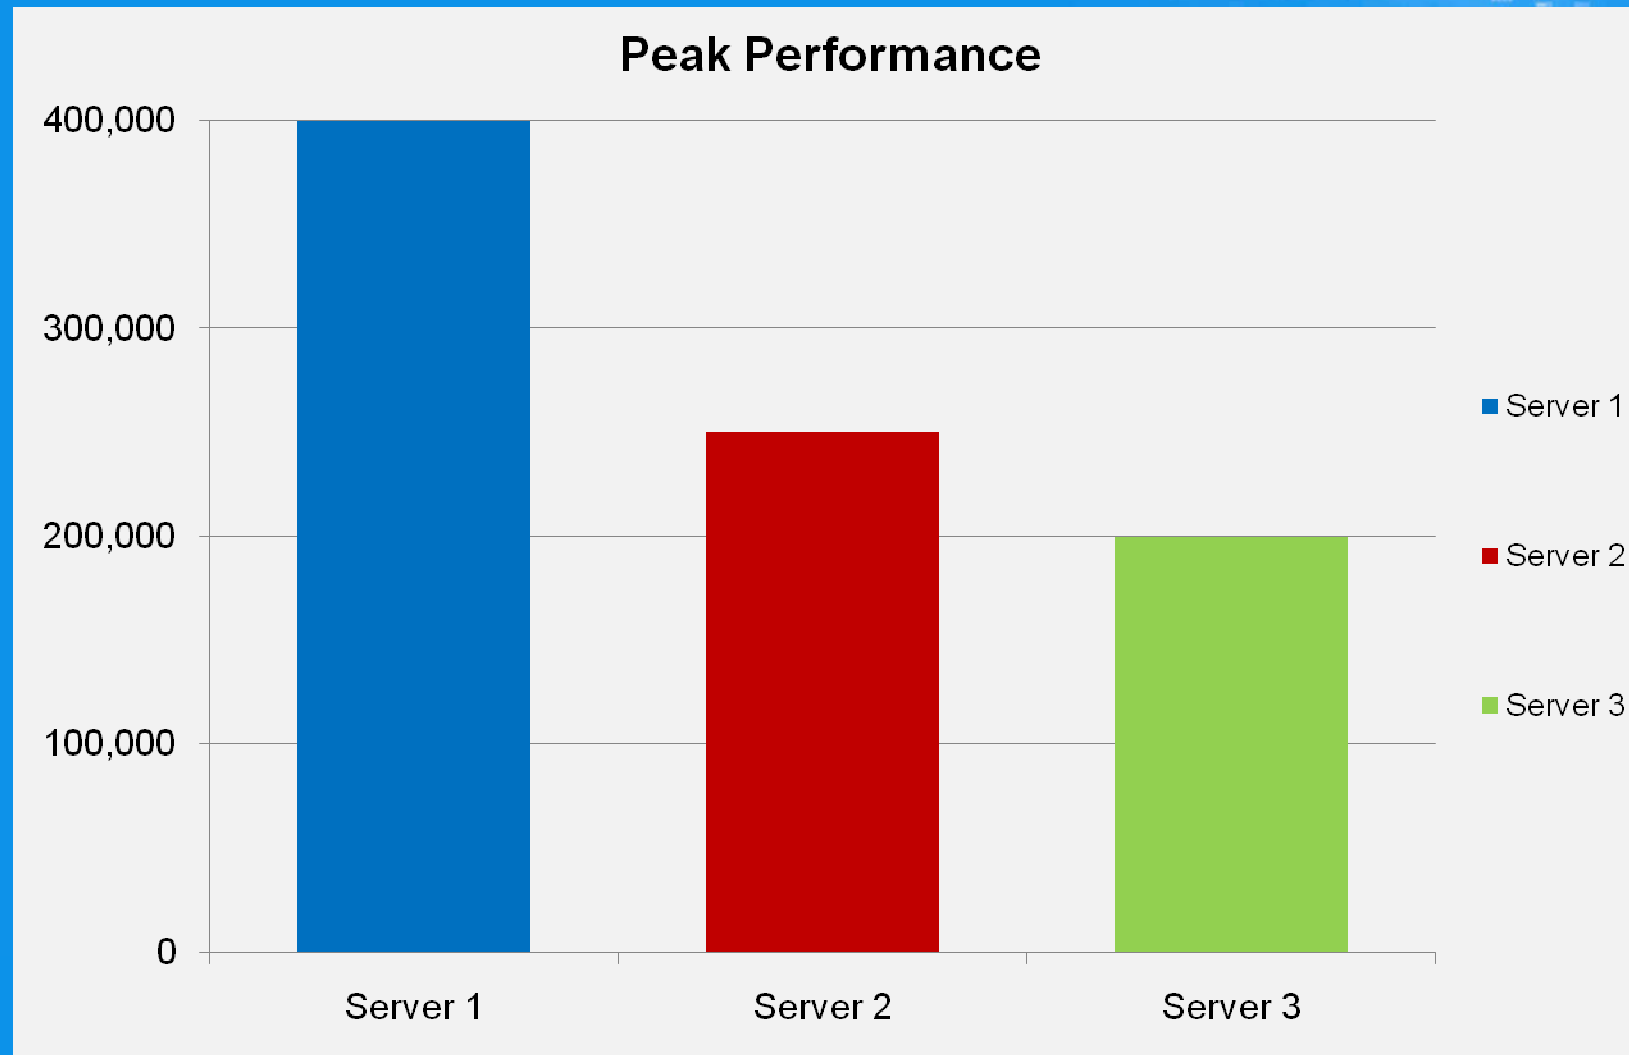

- These structured benchmarks have benefits;
 - Broad expert input
 - Transparent and trusted
 - Structured versioning
 - Established presence

Energy and Cost efficiency

- To deal with this we seek benchmarks which;
 - Report energy consumption
 - Report a range of *actual delivered* load
 - Represent real deployment scenarios

Energy Benchmarks

Goals of Benchmarks

Types of Benchmark

Generalised Benchmarks

Standard energy reporting

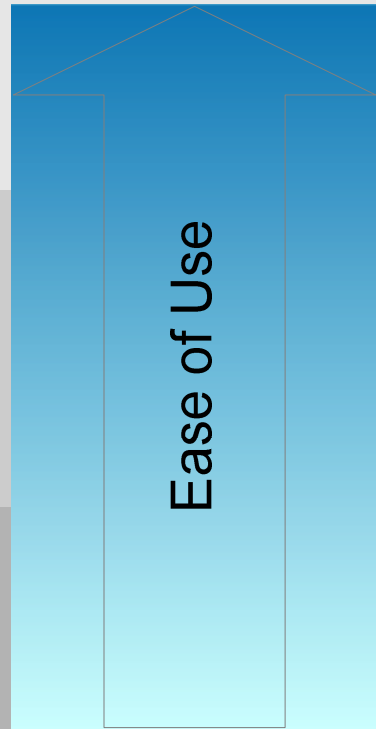

Next phase

Generalised Benchmarks

- Can we have an 'Overall Score'?
- Can we preserve any value?

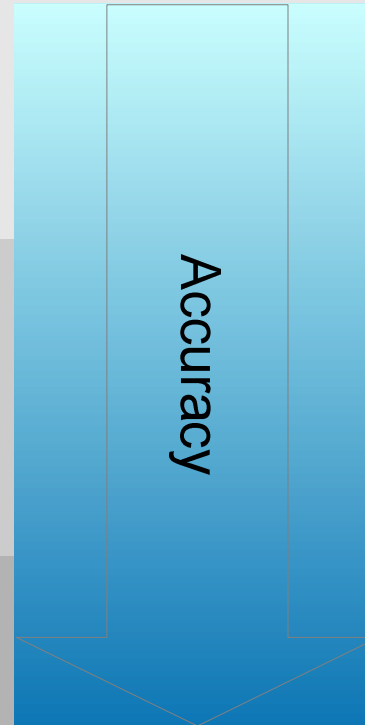

Generality of Benchmark

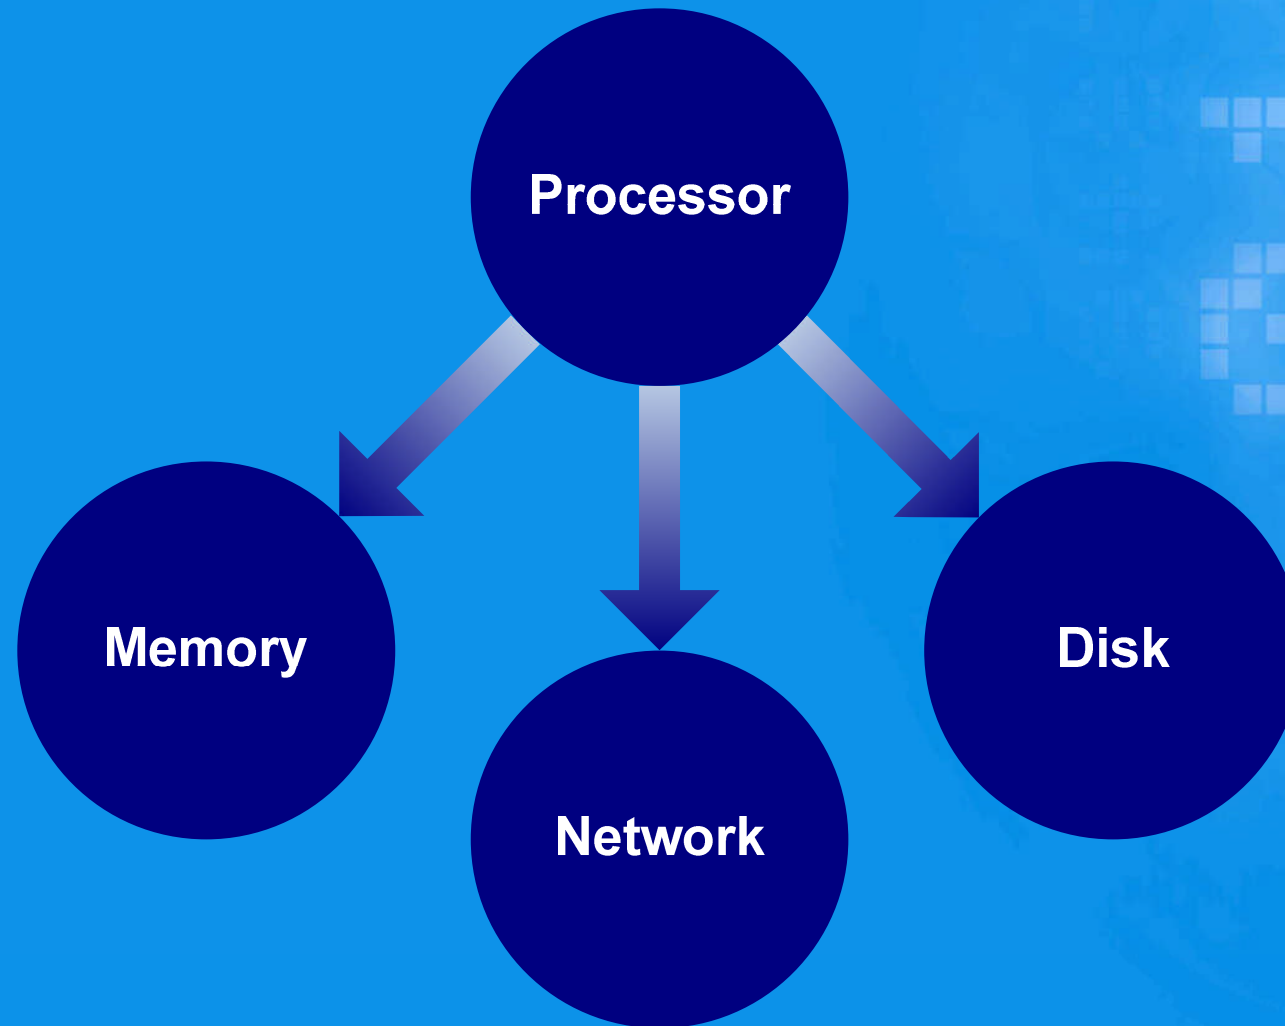

Generalised Benchmark
1st Order Approximation

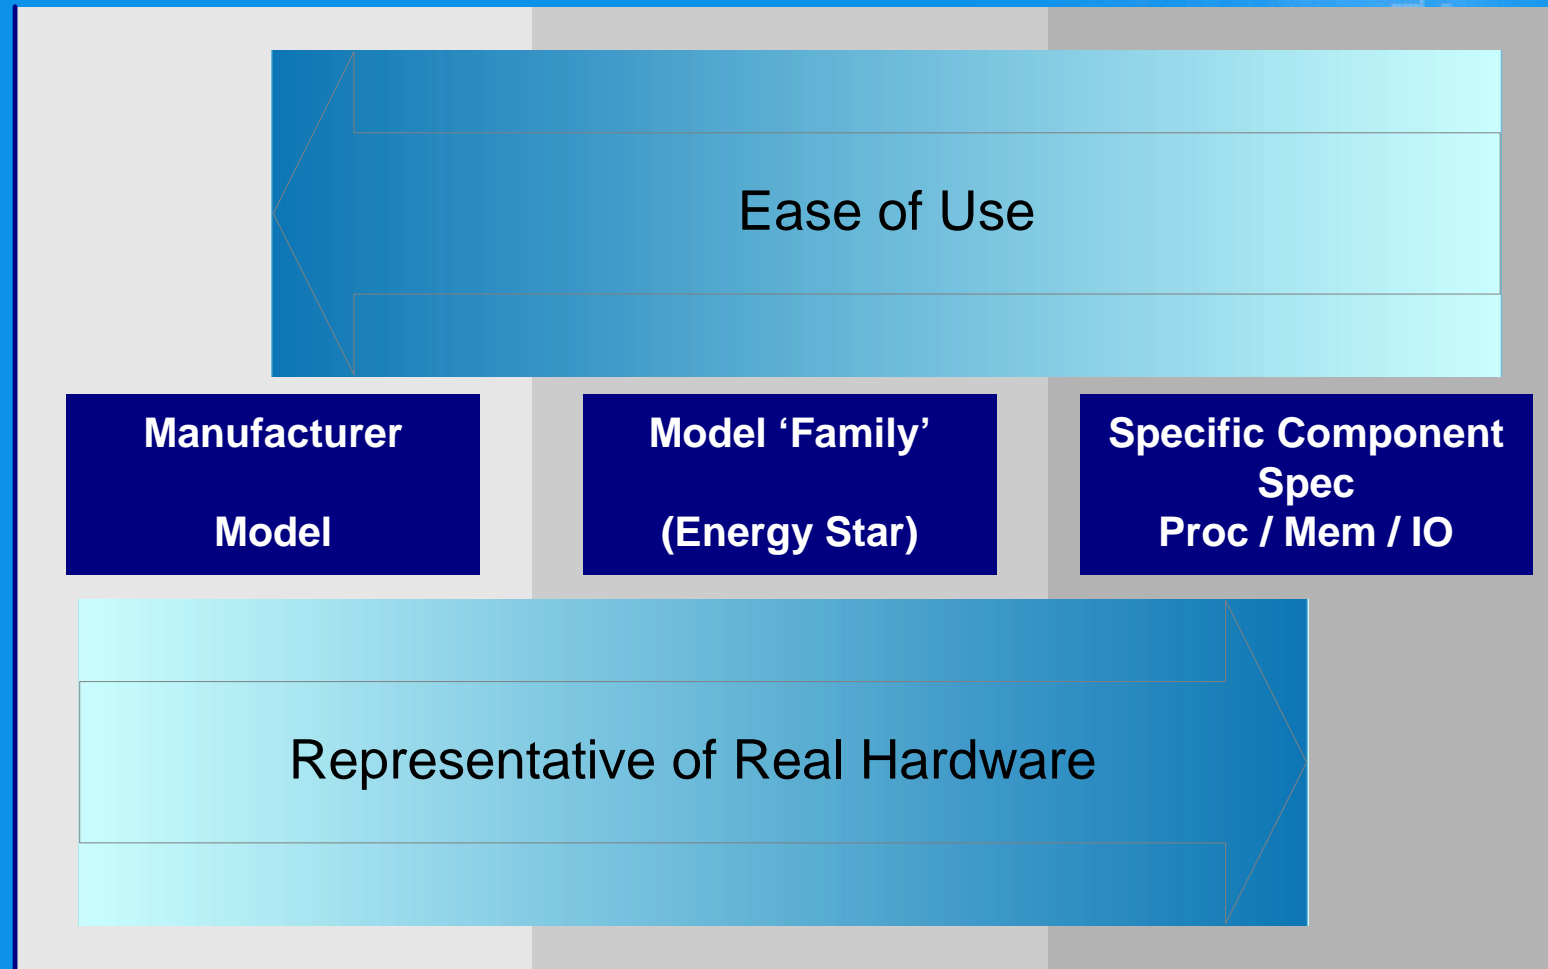

Application Proxy Benchmark
2nd Order Approximation

Real Application Data
3rd Order Approximation

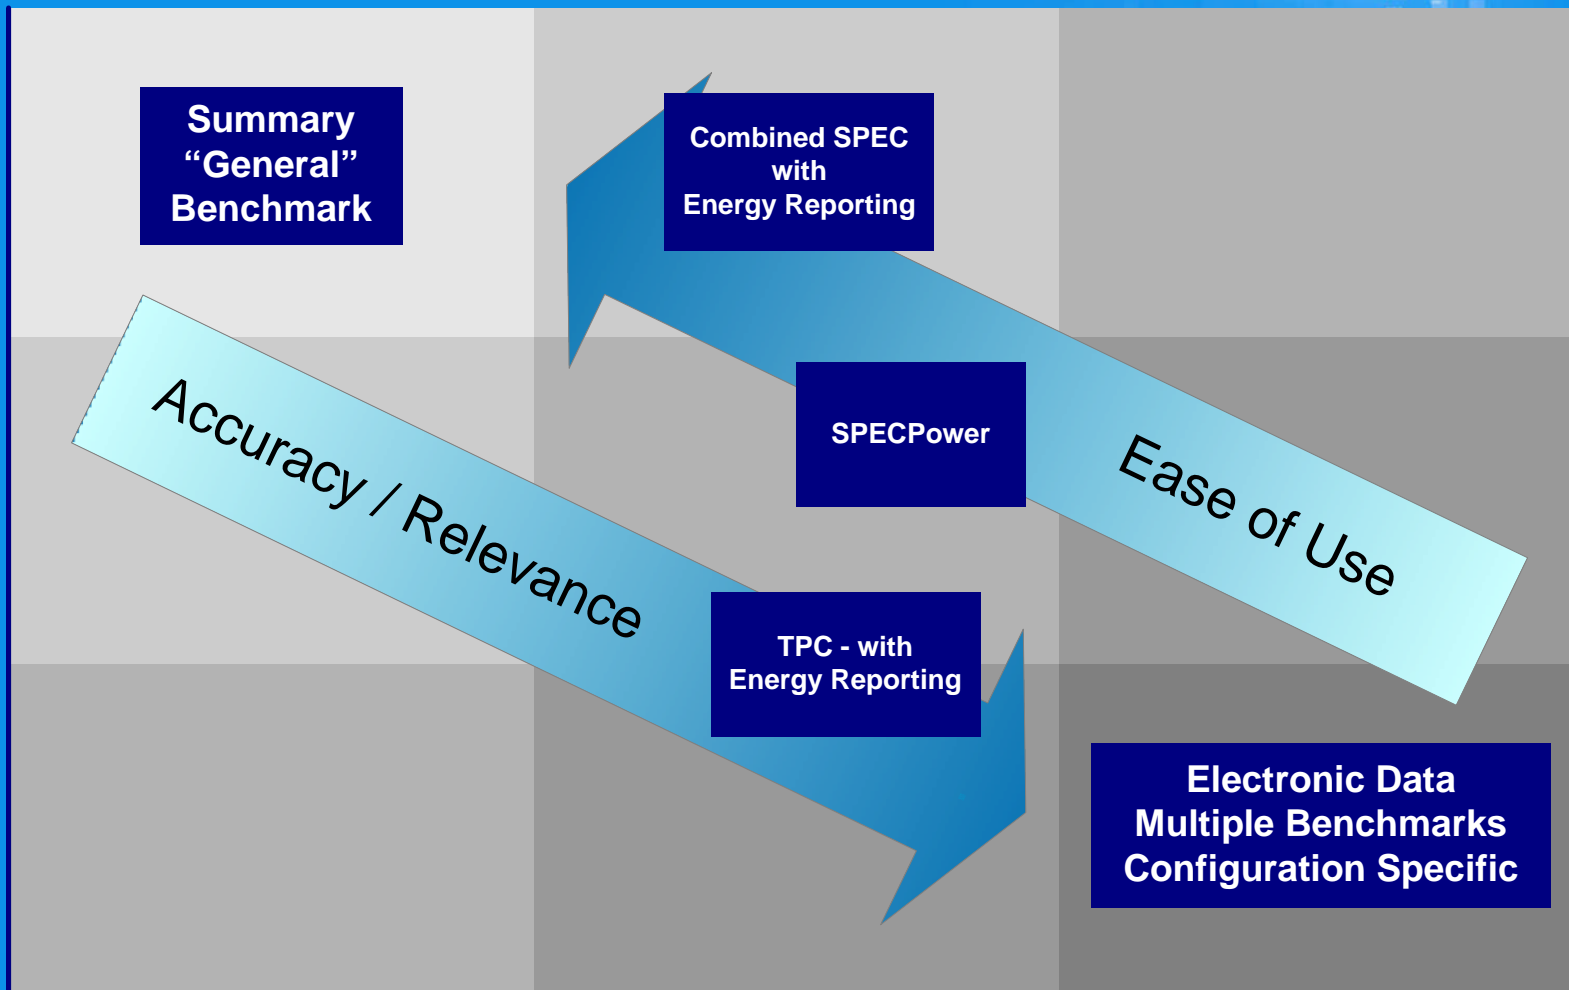

- May drive 'benchmark engineering' toward the benchmark not real use cases
- A general score may be misleading
 - Scores must have context
 - Limitations must be clear
- Hardware combinations

Device and Component Combinatorics

Generality of Benchmark

Device and Component Combinatorics

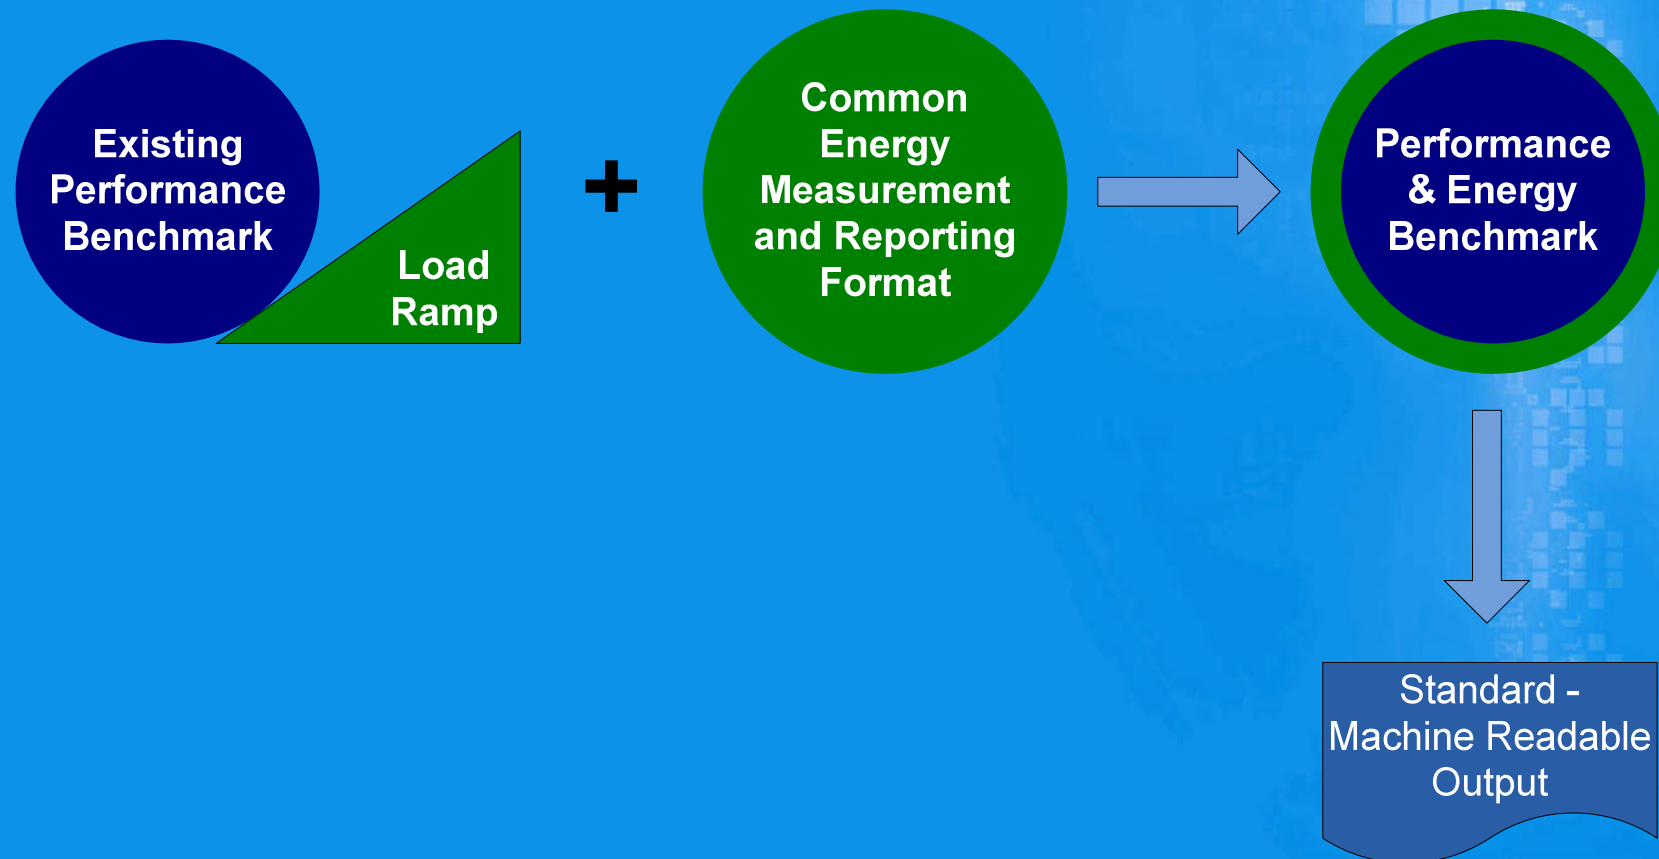

Energy Benchmarks

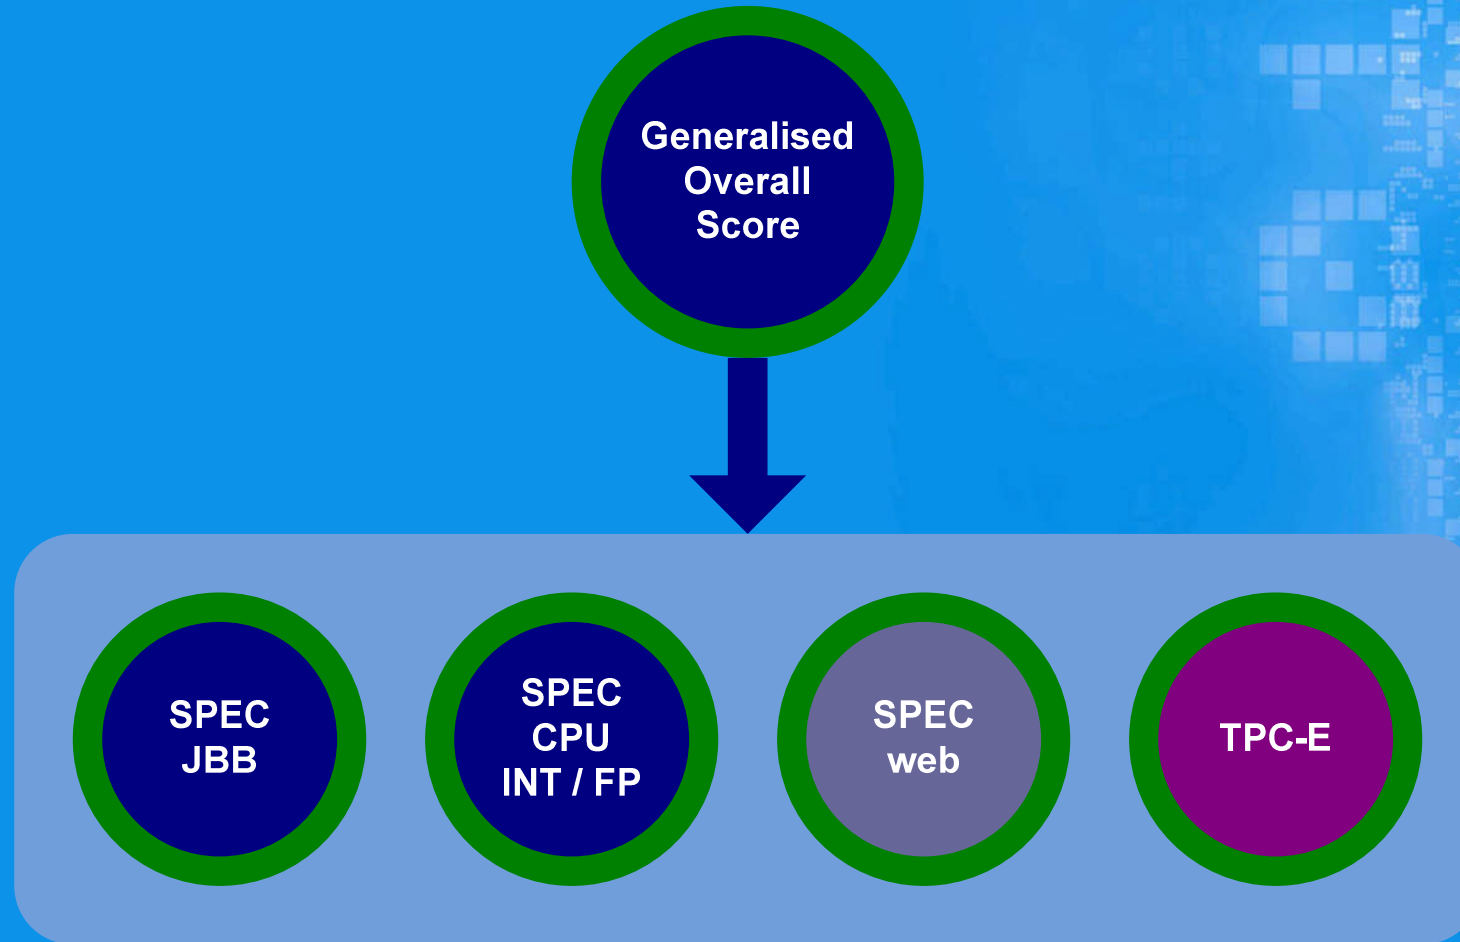

- Goals of Benchmarks
- Types of Benchmark
- Generalised Benchmarks
- Standard energy reporting
- Next phase

Standard energy reporting

Overall and Individual

Requires

- Tools to acquire and view this complex data
- Tools to evaluate achieved cost and energy efficiency in a specific environment

Simulation Menu

- [Scenario List](#)
- [Compare Scenarios](#)

Current Scenario: Demo Full IT Scenario

Configuration

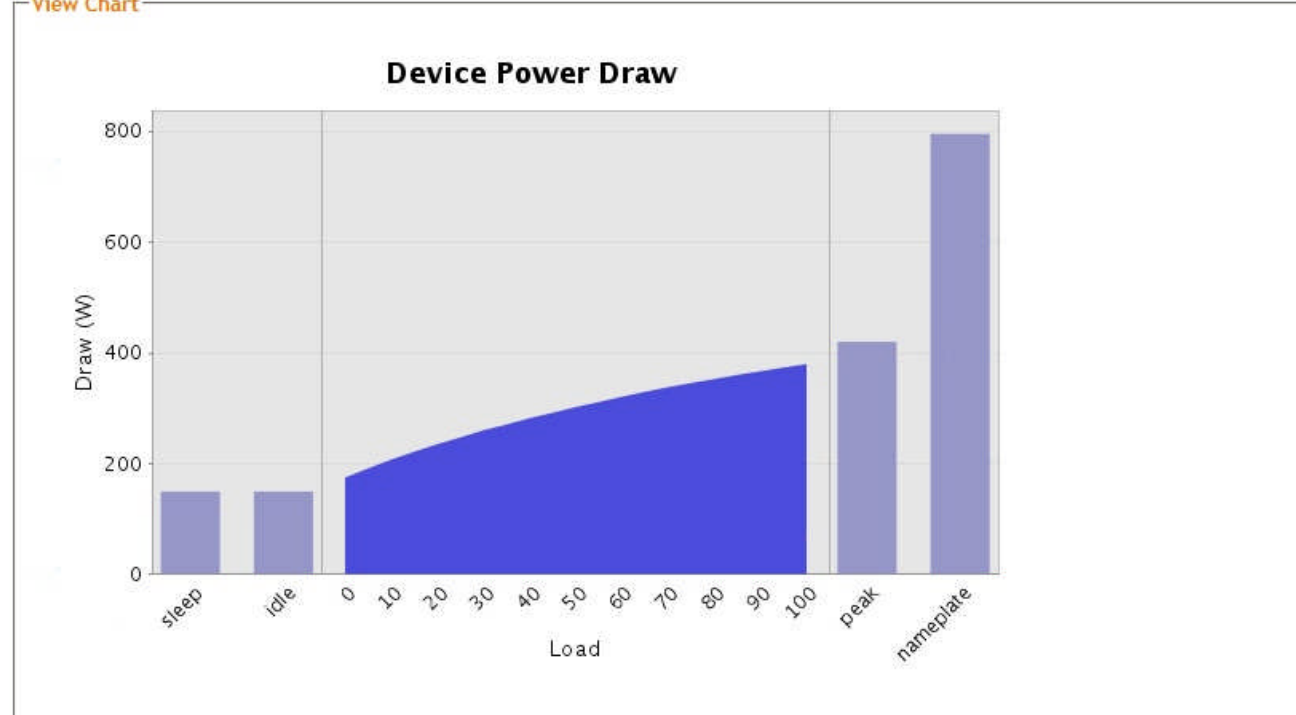

- [Scenario Settings](#)
- [Data Centre Layout](#)
- [Data Centre Capacity](#)
- [Operational Settings](#)
- [M&E Settings](#)
- [IT Settings](#)**

Actions

- [Run Simulation](#)
- [View Results](#)

[IT Settings](#) -> [IT Device Settings](#) -> [Edit IT Device Specification](#) -> [Load Power Profile](#)

View Chart

[Return](#)

Simulation Tools

Simulation tools allow users to compare using this detailed data

data centre simulator v0.11

Comparison Results

Overall IT Device(s) Cost

Overall IT Device(s) Energy Use

Energy Benchmarks

Goals of Benchmarks
Types of Benchmark
Generalised Benchmarks
Standard energy reporting
Next phase

- Automatic management and optimisation
 - Data centres are too complex for human tuning
- Allocate cost and energy to delivered services
 - Virtualisation and shared infrastructure have broken our ability to relate services to physical environments and costs
 - Monitoring and billing systems need this data

Thank you
