Hewlett Packard Company (HP) believes that the information in this document is accurate as of the publication date. The information in this document is subject to change without notice. HP assumes no responsibility for any errors that may appear in this document. The pricing information in this document is believed to accurately reflect the current prices as of the publication date. However, HP provides no warranty of the pricing information in this document.

Benchmark results are highly dependent upon workload, specific application requirements, and system design and implementation. Relative system performance will vary as a result of these and other factors. Therefore, TPC Benchmark C should not be used as a substitute for a specific customer application benchmark when critical capacity planning and/or product evaluation decisions are contemplated.

All performance data contained in this report were obtained in a rigorously controlled environment. Results obtained in other operating environments may vary significantly. HP does not warrant or represent that a user can or will achieve similar performance expressed in transactions per minute (tpmC) or normalized price/performance (\$/tpmC). No warranty of system performance or price/performance is expressed or implied in this report.

# Preface

---

The TPC Benchmark C was developed by the Transaction Processing Performance Council (TPC). The TPC was founded to define transaction processing benchmarks and to disseminate objective, verifiable performance data to the industry. This full disclosure report is based on the TPC Benchmark C Standard Specifications Version 5.9, released June, 2007.

## TPC Benchmark C Overview

The TPC describes this benchmark in Clause 0.1 of the specifications as follows:

TPC Benchmark C is an On Line Transaction Processing (OLTP) workload. It is a mixture of read-only and update intensive transactions that simulate the activities found in complex OLTP application environments. It does so by exercising a breadth of system components associated with such environments, which are characterized by:

- The simultaneous execution of multiple transaction types that span a breadth of complexity
- On-line and deferred transaction execution modes
- Multiple on-line terminal sessions
- Moderate system and application execution time
- Significant disk input/output
- Transaction integrity (ACID properties)
- Non-uniform distribution of data access through primary and secondary keys
- Databases consisting of many tables with a wide variety of sizes, attributes, and relationships
- Contention of data access and update

The performance metric reported by TPC-C is a “business throughput” measuring the number of orders processed per minute. Multiple transactions are used to simulate the business activity of processing an order, and each transaction is subject to a response time constraint. The performance metric for this benchmark is expressed in transactions-per-minute-C (tpmC). To be compliant with the TPC-C standard, all references to tpmC results must include the tpmC rate, the associated price-per-tpmC, and the availability date of the priced configuration.

TPC-C uses terminology and metrics that are similar to other benchmarks, originated by the TPC or others. Such similarity in terminology does not in any way imply that TPC-C results are comparable to other benchmarks. The only benchmark results comparable to TPC-C are other TPC-C results conformant with the same revision.

Despite the fact that this benchmark offers a rich environment that emulates many OLTP applications, this benchmark does not reflect the entire range of OLTP requirements. In addition, the extent to which a customer can achieve the results reported by a vendor is highly dependent on how closely TPC-C approximates the customer application. The relative performance of systems derived from this benchmark does not necessarily hold for other workloads or environments. Extrapolations to other environments are not recommended.

Benchmark results are highly dependent upon workload, specific application requirements, and systems design and implementation. Relative system performance will vary as a result of these and other factors. Therefore, TPC-C should not be used as a substitute for a specific customer application benchmark when critical capacity planning and/or product evaluation decisions are contemplated.

Menu	0.106	0.102	1.562

### **Transaction Mix, in percent of total transaction**

New-Order	44.915%
Payment	43.020%
Order-Status	4.020%
Delivery	4.025%
Stock-Level	4.020%

### **Emulation Delay (in seconds)**

	<b>Resp.Time</b>	<b>Menu</b>
New-Order	0.10	0.10
Payment	0.10	0.10
Order-Status	0.10	0.10
Delivery (interactive)	0.10	0.10
Stock-Level	0.10	0.10

### **Keying/Think Times (in seconds)**

	<b>Min.</b>	<b>Average</b>	<b>Max.</b>
New-Order	18.005/0.00	18.005/12.010	18.013/120.037
Payment	3.010/0.00	3.010/12.011	3.018/120.096
Order-Status	2.010/0.00	2.010/10.011	2.017/100.013
Delivery (interactive)	2.010/0.00	2.010/5.020	2.014/50.153
Stock-Level	2.010/0.00	2.010/5.011	2.016/49.995

### **Test Duration**

Ramp-up time	70 Min. 17 Sec.
Measurement interval	127 minutes
Transactions (all types) completed during measurement interval	28,969,542
Ramp down time	63 Min 43 Sec.

### **Checkpointing**

Number of checkpoints	4
Checkpoint interval	29:04

# *Abstract*

---

## **Overview**

This report documents the methodology and results of the TPC Benchmark C test conducted on the hp ProLiant ML350 G5. The operating system used for the benchmark was Red Hat Enterprise Linux 4. The DBMS used was Oracle Database 10g Standard Edition One.

## **TPC Benchmark C Metrics**

The standard TPC Benchmark C metrics, tpmC (transactions per minute), price per tpmC (three year capital cost per measured tpmC), and the availability date are reported as:

102,454 tpmC

\$0.73 USD per tpmC

Available as of December 31, 2007.

## **Standard and Executive Summary Statements**

The following pages contain an executive summary of results for this benchmark.

## **Auditor**

The benchmark configuration, environment and methodology were audited by Lorna Livingtree of Performance Metrics Inc. to verify compliance with the relevant TPC specifications.

# General Items

---

## Application Code and Definition Statements

The application program (as defined in clause 2.1.7) must be disclosed. This includes, but is not limited to, the code implementing the five transactions and the terminal input output functions.

Appendix A contains all source code implemented in this benchmark.

## Test Sponsor

A statement identifying the benchmark sponsor(s) and other participating companies must be provided.

This benchmark was sponsored by Hewlett Packard Company. The benchmark was developed and engineered by Hewlett Packard Company and Oracle Corporation. Testing took place at HP Performance Engineering Laboratory in Houston, Texas.

## Parameter Settings

Settings must be provided for all customer-tunable parameters and options which have been changed from the defaults found in actual products, including by not limited to:

- Database options
- Recover/commit options
- Consistency locking options
- Operating system and application configuration parameters

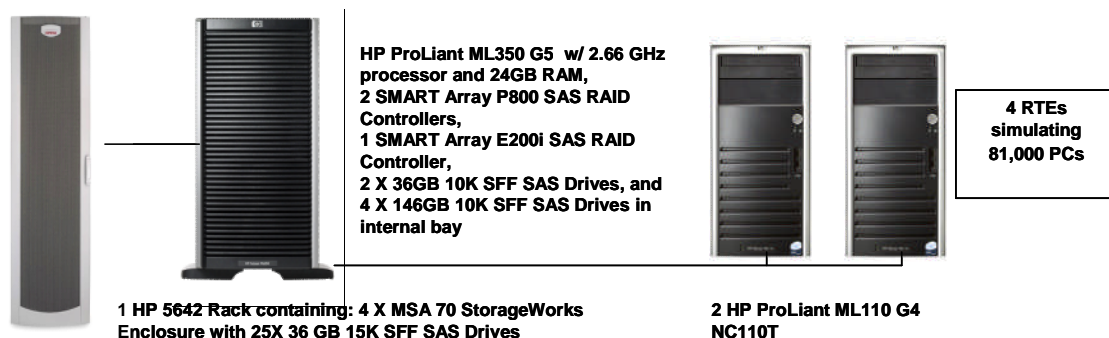

This requirement can be satisfied by providing a full list of all parameters.

Appendix C contains the tunable parameters for the database, the operating system, and the transaction monitor.

## Configuration Items

Diagrams of both measured and priced configurations must be provided, accompanied by a description of the differences. The configuration diagram for both the tested and priced system are the same and included on the following page

**Figure 1. Benchmarked and Priced Configuration**

# Clause 1 Related Items

---

## Table Definitions

Listing must be provided for all table definition statements and all other statements used to set up the database. Appendix B contains the code used to define and load the database tables.

## Physical Organization of Database

The physical organization of tables and indices within the database must be disclosed.

84 disks used in the benchmark had a capacity of 18.2GB 15K rpm, and 2 disks used in the benchmark had a capacity of 146.8 GB 10K rpm.

Controller	Storage	Unformatted Capacity	Contents
HP SMART Array P800	2xMSA 70 Enclosures containing 50x36 GB 15K rpm SFF SAS disk drives	1,690.00 GB	1/2 Tables and Indexes
HP SMART Array P800	2xMSA 70 Enclosures containing 50x36 GB 15K rpm SFF SAS disk drives	1,690.00 GB	1/2 Tables and Indexes
HP SMART Array E200i	Internal drive bays	33.80 GB	O/S
	1x36 GB 10K rpm SFF SAS disk drive 4x146 GB 10K rpm SFF SAS disk drives	546.80 GB	Database Logs

## Priced Configuration:

All hardware and software remained the same between the benchmarked and priced configurations.

## Insert and Delete Operations

It must be ascertained that insert and/or delete operations to any of the tables can occur concurrently with the TPC-C transaction mix. Furthermore, any restrictions in the SUT database implementation that precludes inserts beyond the limits defined in Clause 1.4.11 must be disclosed. This includes the maximum number of rows that can be inserted and the minimum key value for these new rows.

All insert and delete functions were verified to be fully operational during the entire benchmark.

## Partitioning

While there are a few restrictions placed upon horizontal or vertical partitioning of tables and rows in the TPC-C benchmark, any such partitioning must be disclosed.

None.

## Replication, Duplication or Additions

Replication of tables, if used, must be disclosed. Additional and/or duplicated attributes in any table must be disclosed along with a statement on the impact on performance.

No replications, duplications or additional attributes were used in this benchmark.

# Clause 2 Related Items

---

## **Random Number Generation**

*The method of verification for the random number generation must be described.*

Random numbers were generated using the drand48() and lrand48() UNIX calls. These functions generate pseudo random numbers using the linear congruential algorithm and 48-bit integer arithmetic. The random number generators are initially seeded using the srand48() call.

## **Input/Output Screen Layout**

*The actual layout of the terminal input/output screens must be disclosed.*

All screen layouts followed the specifications exactly.

## **Priced Terminal Feature Verification**

*The method used to verify that the emulated terminals provide all the features described in Clause 2.2.2.4 must be explained. Although not specifically priced, the type and model of the terminals used for the demonstration in 8.1.3.3 must be disclosed and commercially available (including supporting software and maintenance).*

The terminal attributes were verified by the auditor manually exercising each specification on a representative ProLiant ML110.

## **Presentation Manager or Intelligent Terminal**

*Any usage of presentation managers or intelligent terminals must be explained.*

Application code running on the client machines implemented the TPC-C user interface. No presentation manager software or intelligent terminal features were used. The source code for the forms applications is listed in Appendix A.

## Transaction Statistics

Table 2.1 lists the numerical quantities that Clauses 8.1.3.5 to 8.1.3.11 require.

**Table 2.1 Transaction Statistics**

Statistic		Value
New Order	Home warehouse order lines	99.00%
	Remote warehouse order lines	1.00%
	Rolled back transactions	1.00%
	Average items per order	10.00
Payment	Home warehouse	85.01%
	Remote warehouse	14.99%
	Accessed by last name	60.01%
Order Status	Accessed by last name	60.05%
Delivery	Skipped transactions	None
Transaction Mix	New Order	44.915%
	Payment	43.020%
	Order status	4.020%
	Delivery	4.025%
	Stock level	4.020%

## Queuing Mechanism

*The queuing mechanism used to defer the execution of the Delivery transaction must be disclosed.*

Microsoft COM+ on each client system served as the queuing mechanism to the database. Each delivery request was submitted to Microsoft COM+ asynchronously with control being returned to the client process immediately and the deferred delivery part completing asynchronously.

# Clause 3 Related Items

---

## Transaction System Properties (ACID)

*The results of the ACID tests must be disclosed along with a description of how the ACID requirements were met. This includes disclosing which case was followed for the execution of Isolation Test 7.*

All ACID property tests were successful. The executions are described below.

### Atomicity

*The system under test must guarantee that the database transactions are atomic; the system will either perform all individual operations on the data or will assure that no partially completed operations leave any effects on the data.*

#### Completed Transactions

A row was randomly selected from the warehouse, district and customer tables, and the balances noted. A payment transaction was started with the same warehouse, district and customer identifiers and a known amount. The payment transaction was committed and the rows were verified to contain correctly updated balances.

#### Aborted Transactions

A row was randomly selected from the warehouse, district and customer tables, and the balances noted. A payment transaction was started with the same warehouse, district and customer identifiers and a known amount. The payment transaction was rolled back and the rows were verified to contain the original balances.

### Consistency

*Consistency is the property of the application that requires any execution of a database transaction to take the database from one consistent state to another, assuming that the database is initially in a consistent state.*

Consistency conditions one through four were tested using a shell script to issue queries to the database. The results of the queries verified that the database was consistent for all four tests.

A run was executed under full load over two hours with checkpoints.

The shell script was executed again. The result of the same queries verified that the database remained consistent after the run.

### Isolation

*Sufficient conditions must be enabled at either the system or application level to ensure the required isolation defined above (clause 3.4.1) is obtained.*

Isolation tests one through nine were executed using shell scripts to issue queries to the database. Each included timestamps to demonstrate the concurrency of operations. The results of the queries were captured to files. The captured files were verified by the auditor to demonstrate the required isolation had been met.

Isolation test 7 followed Case D, where T3 does not stall and no transaction is ROLLED BACK. T4 query of item price verifies to the changed prices of T3.

## Durability

*The tested system must guarantee durability: the ability to preserve the effects of committed transaction and insure database consistency after recovery from any one of the failures listed in Clause 3.5.3.*

### Durable Media Failure

Durability from media failure was demonstrated on a database scaled for 4000 warehouses. The standard driving mechanism was used to generate the transaction load of 40000 users. The fully scaled database under full load would also have passed the following test.

### Loss of Data

To demonstrate recovery from a permanent failure of durable medium containing TPC-C tables, the following steps were executed:

1. A backup of the database was made.
2. The total number of New Orders was determined by the sum of D\_NEXT\_O\_ID of all rows in the DISTRICT table giving the beginning count. Consistency check 3 was verified before run.
3. The RTE was started with 40500 users
4. The test was allowed to run for a minimum of 5 minutes.
5. Removed a disk from an array containing database data.
6. Oracle10g recorded errors about corrupt data on the partition. The database and the RTE were then shut down.
7. The removed disk was replaced from the spares and the logical drives on that array were restored from backup.
8. The database was then started. The database was recovered using the recover command from SQLPLUS. The database was opened and Oracle 10g performed instance recovery.
9. Consistency conditions were executed and verified.
10. Step 2 was repeated and the difference between the first and second counts was noted.
11. An RTE report was generated for the entire run time giving the number of NEW-ORDERS successfully returned to the RTE.
12. The counts in step 10 and 11 were compared and the results verified that all committed transactions had been successfully recovered.
13. Samples were taken from the RTE files and used to query the database to demonstrate successful transactions had corresponding rows in the ORDER table.

### Loss of Log

To demonstrate recovery from a permanent failure of durable medium containing TPC-C tables, the following steps were executed:

1. The total number of New Orders was determined by the sum of D\_NEXT\_O\_ID of all rows in the DISTRICT table giving the beginning count. Consistency check 3 was verified before run.
2. The RTE was started with 40500 users.
3. The test was allowed to run for a minimum of 5 minutes.
4. A log disk containing log information was removed.
5. The system continued running because the logs are mirrored.
6. The database and the RTE were then shut down.
7. The database was then started. Consistency conditions were executed and verified.
8. Step 1 was repeated and the difference between the first and second counts was noted.

9. An RTE report was generated for the entire run time giving the number of NEW-ORDERS successfully returned to the RTE.
10. The counts in step 8 and 9 were compared and the results verified that all committed transactions had been successfully recovered.
11. Samples were taken from the RTE files and used to query the database to demonstrate successful transactions had corresponding rows in the ORDER table.

### **Instantaneous Interruption, Loss of Memory**

Because loss of power erases the contents of memory, the instantaneous interruption and the loss of memory tests were combined into a single test. This test was executed on a fully scaled database of 8100 warehouses under a full load of 81000 users. The following steps were executed:

1. The total number of New Orders was determined by the sum of D\_NEXT\_O\_ID of all rows in the DISTRICT table giving the beginning count.
2. The RTE was started with 81000 users.
3. The test was allowed to run for a minimum of 5 minutes.
4. A system crash and loss of memory were induced by turning the computer off. No battery backup or Uninterruptible Power Supply (UPS) were used to preserve the contents of memory.
5. The RTE was shutdown.
6. Power was restored and the system restarted.
7. Oracle10g was restarted and performed an automatic recovery.
8. Consistency conditions were executed and verified.
9. Step 1 was repeated and the difference between the first and second counts was noted.
10. An RTE report was generated for the entire run time giving the number of NEW-ORDERS successfully returned to the RTE.
11. The counts in step 9 and 10 were compared and the results verified that all committed transactions had been successfully recovered.
12. Samples were taken from the RTE files and used to query the database to demonstrate successful transactions had corresponding rows in the ORDER table.

---

## Initial Cardinality of Tables

The cardinality (e.g. number of rows) of each table, as it existed at the start of the benchmark run, must be disclosed. If the database was over-scaled and inactive rows of the WAREHOUSE table were deleted, the cardinality of the WAREHOUSE table as initially configured and the number of rows deleted must be disclosed.

**Table 4.1 Number of Rows for Server**

Table	Occurrences
Warehouse	8500
District	85000
Customer	255000000
History	255000000
Order	255000000
New Order	76500000
Order Line	2550403284
Stock	850000000
Item	100000
Unused Warehouses	400

## Database Layout

The distribution of tables and logs across all media must be explicitly depicted for tested and priced systems.

The benchmarked configuration used two SMART Array P800 SAS RAID Controllers, each of which was attached to two MSA 70 StorageWorks Enclosures which contained twentyfive 36 GB 15K rpm SFF SAS disk drives each for the database tables and indexes, and one SMART Array E200i SAS RAID Controllers attached to internal storage bays containing one 36 GB 10K rpm SFF SAS disk drive for the O/S and four 146 GB 10K rpm SFF SAS disk drives for Oracle redo logs. The accelerator caches were enabled for data volumes and were set to 100% write, and the accelerator cache was disabled for the redo log volume, but was enabled for the O/S volume and set at default settings of 50% read and 50% write.

Section 1.2 of this report details the distribution of database tables and logs across all disks. The code that creates the database and tables are included in Appendix B.

## Type of Database

A statement must be provided that describes:

1. The data model implemented by DBMS used (e.g. relational, network, hierarchical).
2. The database interface (e.g. embedded, call level) and access language (e.g. SQL, DL/1, COBOL read/write used to implement the TPC-C transaction. If more than one interface/access language is used to implement TPC-C, each interface/access language must be described and a list of which interface/access language is used with which transaction type must be disclosed.

Oracle Database 10g Edition One is a relational DBMS.

Anonymous block PL/SQL and stored procedures were accessed through the ORACLE Call Interface. Application code is included in Appendix A.

## Database Mapping

*The mapping of database partitions/replications must be explicitly described.*

The database was not replicated. The tables were not partitioned.

## 60 Day Space

*Details of the 60 day space computations along with proof that the database is configured to sustain 8 hours of growth for the dynamic tables (Order, Order-Line, and History) must be disclosed.*

## Throughput

*Measured tpmC must be reported*

Measured tpmC 102454 tpmC

Price per tpmC \$0.73 per tpmC

## Response Times

*Ninetieth percentile, maximum and average response times must be reported for all transaction types as well as for the menu response time.*

**Table 5.1: Response Times**

Type	Average	Maximum	90th %
New-Order	0.202	2.130	0.259
Payment	0.161	1.907	0.207
Order-Status	0.206	1.859	0.276
Interactive Delivery	0.106	1.557	0.102
Deferred Delivery	0.112	1.438	0.249
Stock-Level	0.871	3.240	1.208
Menu	0.106	1.562	0.102

## Keying and Think Times

*The minimum, the average, and the maximum keying and think times must be reported for each transaction type.*

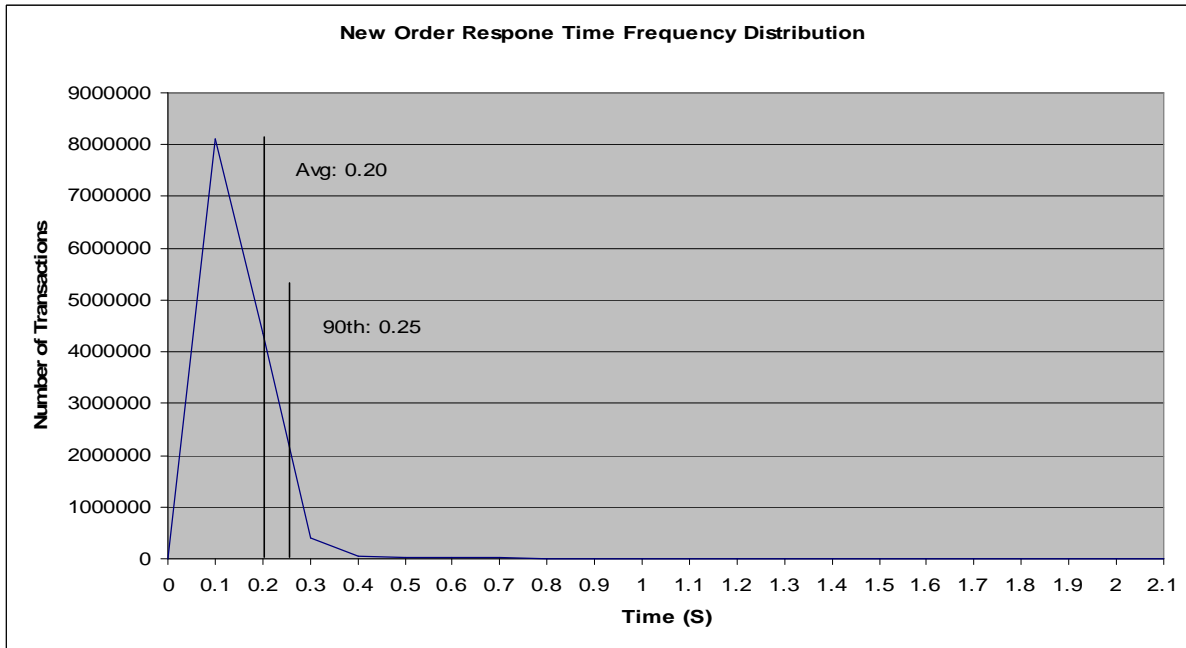

**Table 5.2: Keying Times/Think Times**

Type	Minimum	Average	Maximum
New-Order	18.005/0.00	18.005/12.010	18.013/120.037
Payment	3.010/0.00	3.010/12.011	3.018/120.096
Order-Status	2.010/0.00	2.010/10.011	2.017/100.013
Interactive Delivery	2.010/0.00	2.010/5.020	2.014/50.153
Stock-Level	2.010/0.00	2.010/5.011	2.016/49.995

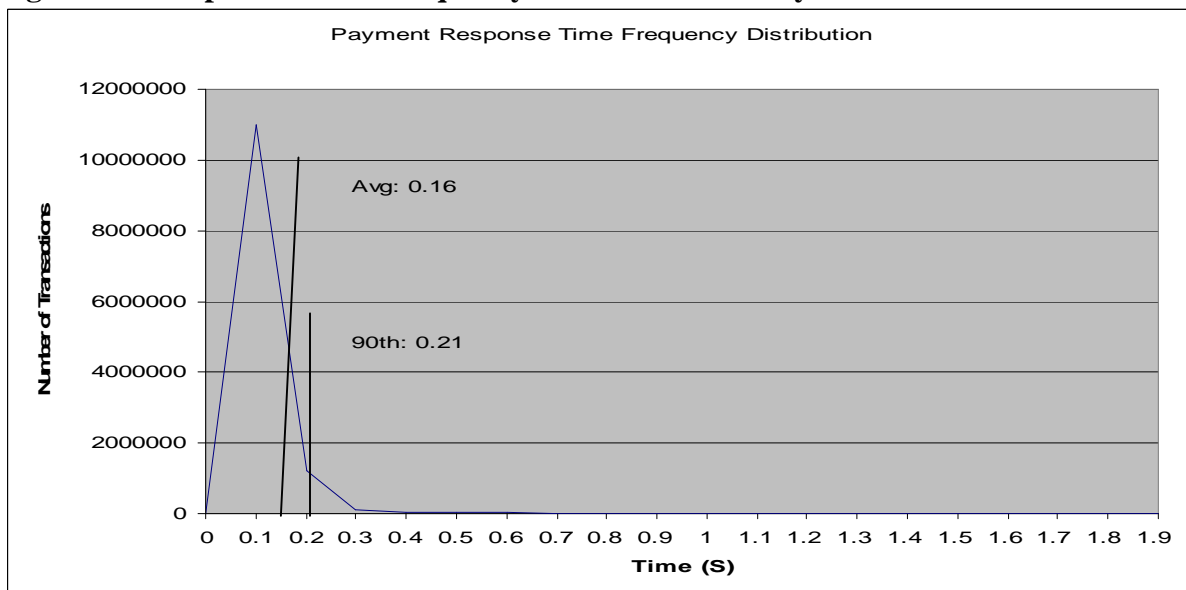

## Response Time Frequency Distribution Curves and Other Graphs

Response Time frequency distribution curves (see Clause 5.6.1) must be reported for each transaction type.  
The performance curve for response times versus throughput (see Clause 5.6.2) must be reported for the New-Order transaction.  
Think Time frequency distribution curves (see Clause 5.6.3) must be reported for each transaction type.  
Keying Time frequency distribution curves (see Clause 5.6.4) must be reported for each transaction type.  
A graph of throughput versus elapsed time (see Clause 5.6.5) must be reported for the New-Order transaction.

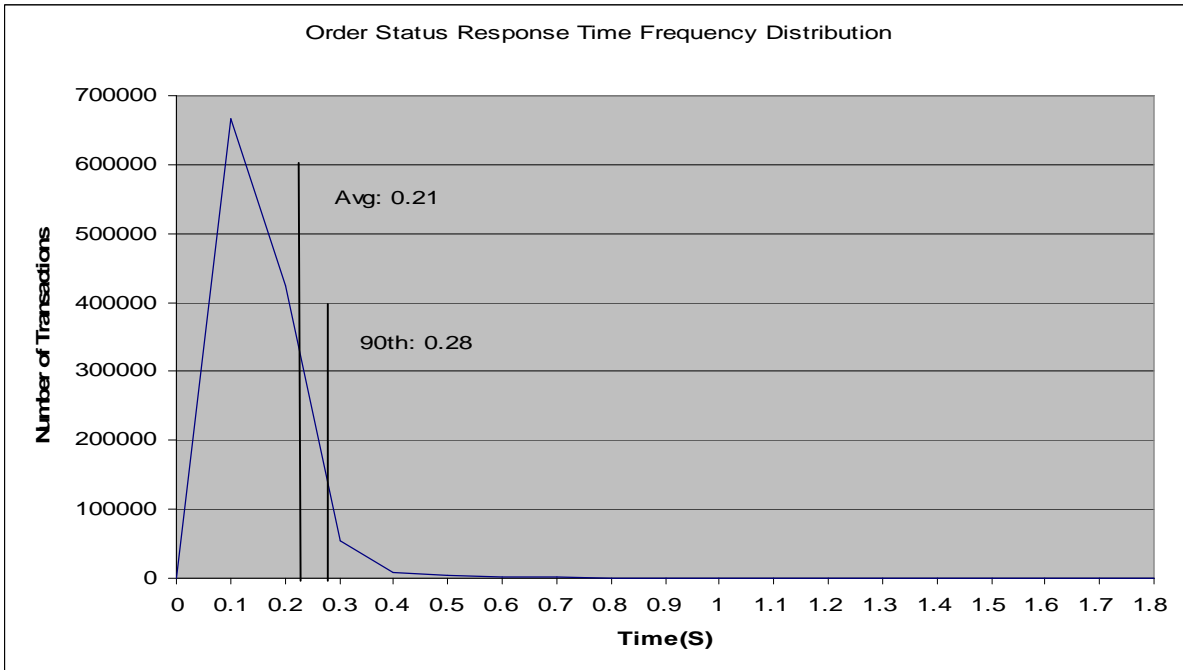

**Figure 5.1: Response Times Frequency Distribution for New Order Transactions**

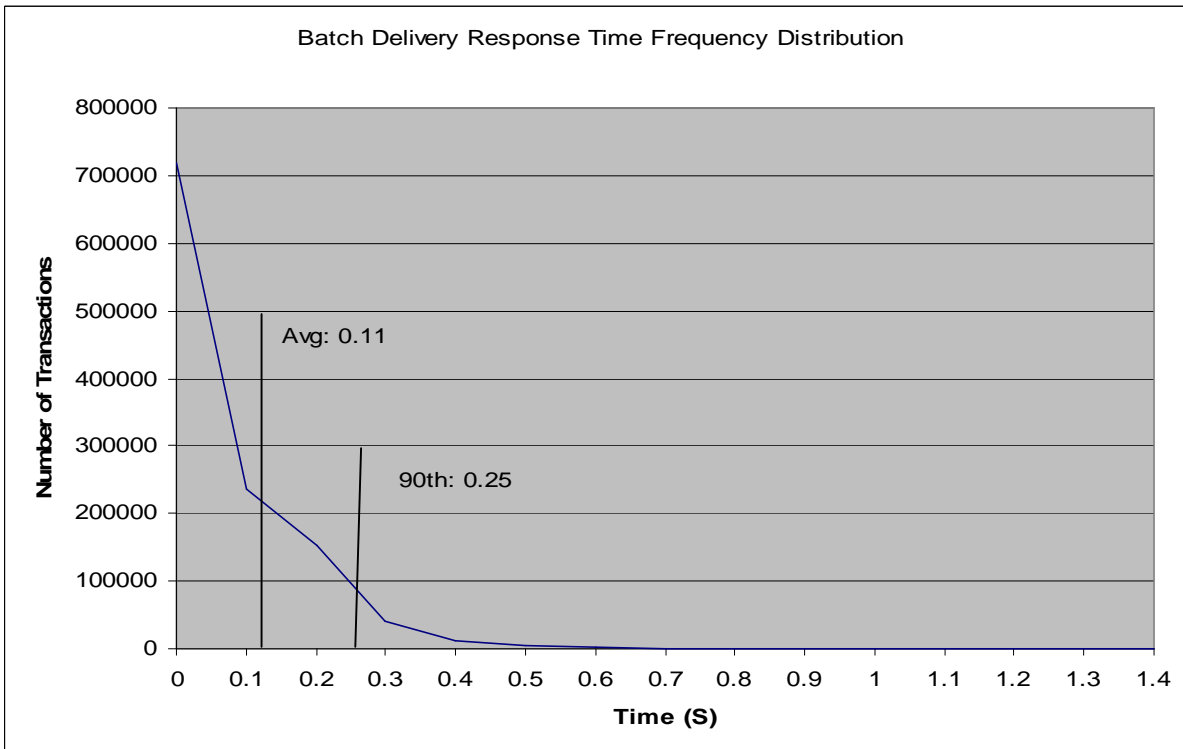

**Figure 5.2: Response Times Frequency Distribution for Payment Transactions**

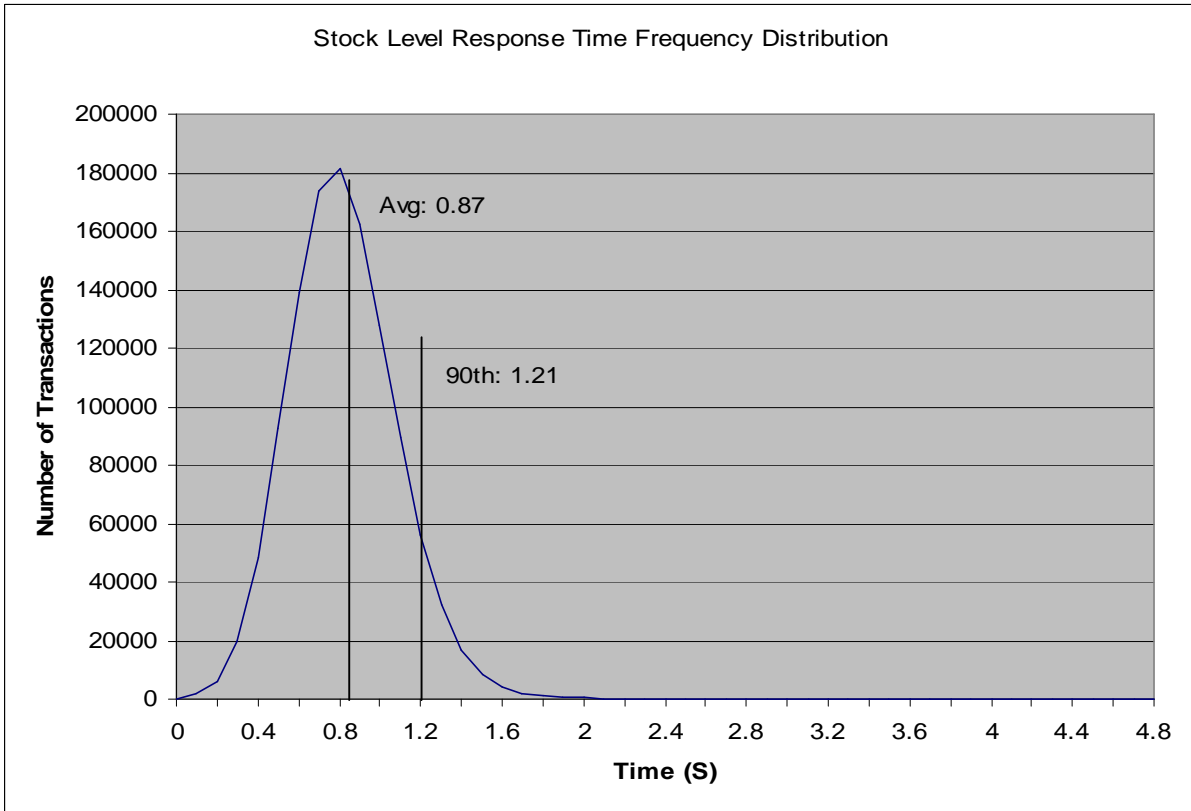

**Figure 5.3: Response Times Frequency Distribution for Order Status Transactions**

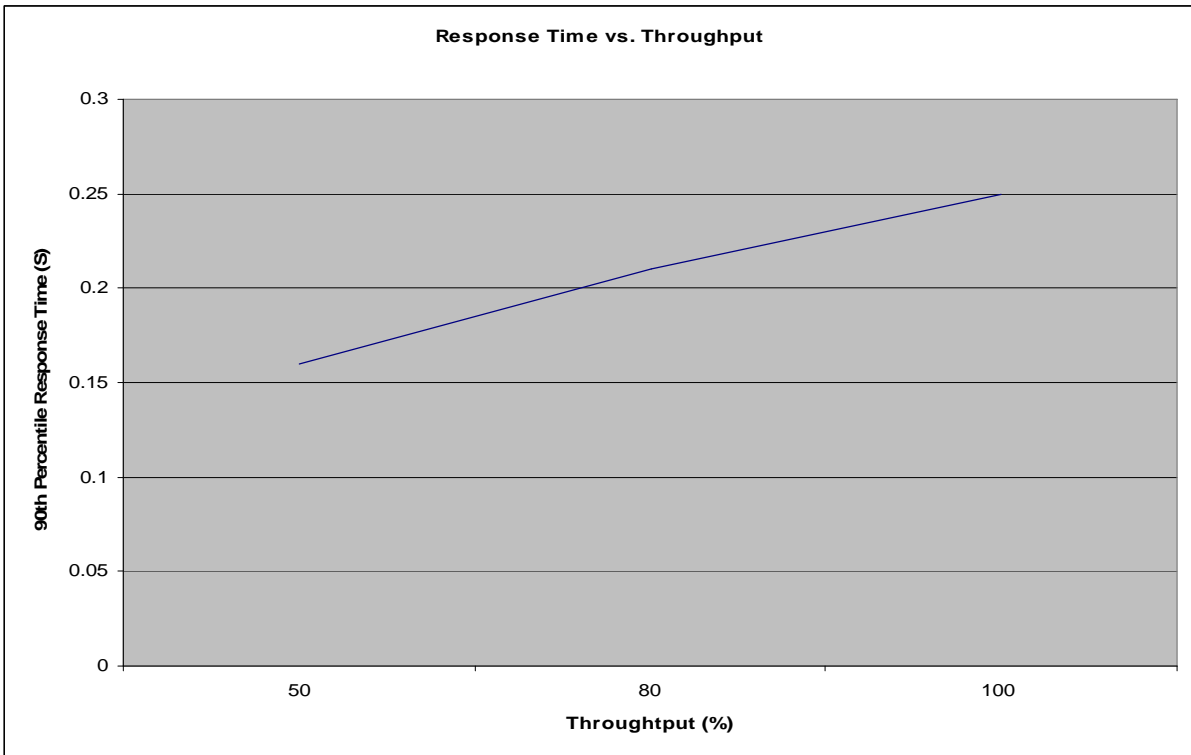

**Figure 5.4: Response Times Frequency Distribution for Delivery Transactions**

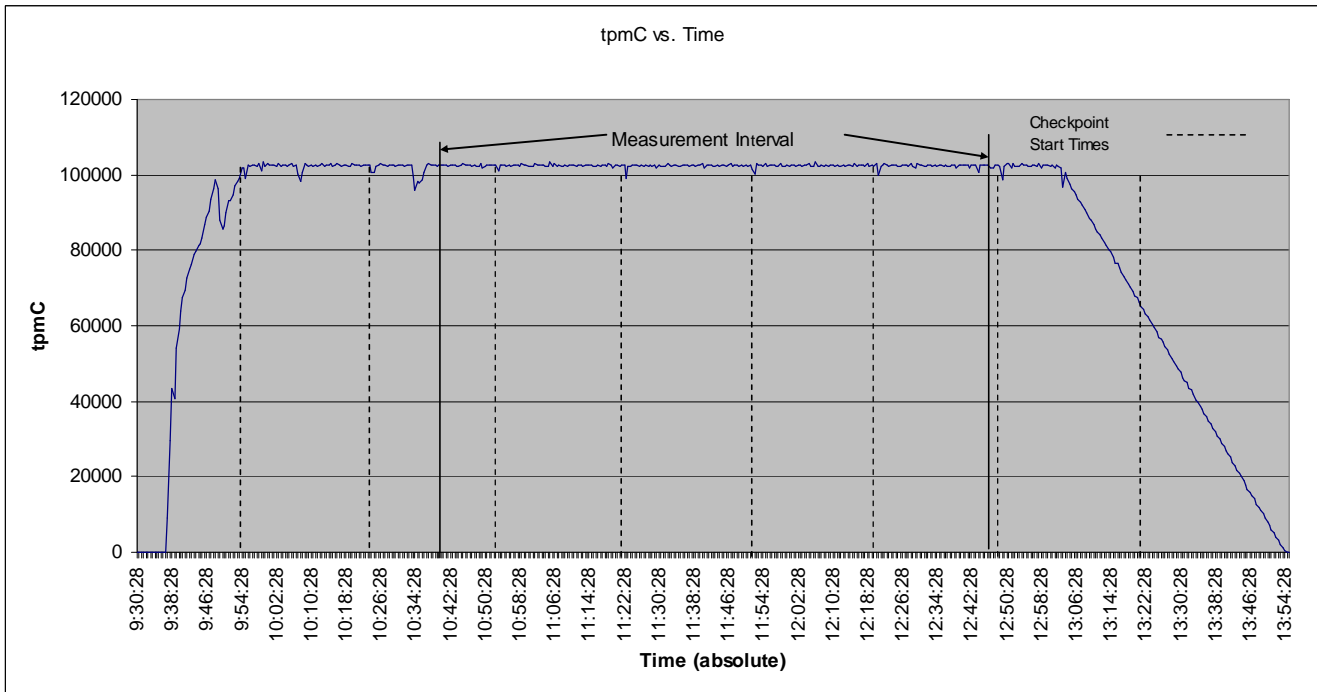

**Figure 5.6: Response Time versus Throughput**

**Figure 5.7: Think Times distribution for New Order Transactions**

**Figure 5.8: Throughput versus Time**

## Steady State Determination

*The method used to determine that the SUT had reached a steady state prior to commencing the measurement interval must be disclosed.*

Steady state was determined using real time monitor utilities from both the operating system and the RTE. Steady state was further confirmed by the throughput data collected during the run and graphed in Figure 5.8.

## Work Performed During Steady State

*A description of how the work normally performed during a sustained test (for example checkpointing, writing redo/undo log records, etc.) actually occurred during the measurement interval must be reported.*

For each of the TPC Benchmark C transaction types, the following steps are executed. Each emulated user starts an Internet browser and asks to attach to the application on the desired client. The application formats the menus, input forms and data output using HTML (HyperText Markup Language). The HTML strings are transmitted over TCP/IP back to the client, where they can be displayed by any Web Browser software. The application on the client is run under the control of the Microsoft IIS.

Transactions are submitted by the RTE in accordance with the rules of the TPC-C benchmark. The emulated user chooses a transaction from the menu. The RTE records the time it takes from selecting the menu item to receiving the requested form. Data is generated for input to the form, then the user waits the specified keying time. The submit is sent and the RTE records the time it takes for the transaction to be processed and all the output data to be returned. The user then waits for the randomly generated think time before starting the process over again. All timings taken by the RTE generate a start and end timestamp. Keying and think times are calculated as the difference between end-time of a timing to the start of the next.

The database records transactions in the database tables and the transaction log. Writes to the database may stay in Oracle's in-memory data cache for a while before being written to disk. Checkpoints are initiated once the log files were filled and allowed to roll over.

## Measurement Period Duration

*A statement of the duration of the measurement interval for the reported Maximum Qualified Throughput (tpmC) must be included.*

The reported measured interval was 7200 seconds.

## Regulation of Transaction Mix

*The method of regulation of the transaction mix (e.g., card decks or weighted random distribution) must be described. If weighted distribution is used and the RTE adjusts the weights associated with each transaction type, the maximum adjustments to the weight from the initial value must be disclosed.*

The RTE was given a weighted random distribution, which could not be adjusted during the run.

## Transaction Statistics

*The percentage of the total mix for each transaction type must be disclosed. The percentage of New-Order transactions rolled back as a result of invalid item number must be disclosed. The average number of order-lines entered per New-Order transaction must be disclosed. The percentage of remote order lines per New-Order transaction must be disclosed. The percentage of remote Payment transactions must be disclosed. The percentage of customer selections by customer last name in the Payment and Order-Status transactions must be disclosed. The percentage of Delivery transactions skipped due to there being fewer than necessary orders in the New-Order table must be disclosed.*

**Table 5.3: Transaction Statistics**

Statistic		Value
New Order	Home warehouse order lines	99.00%
	Remote warehouse order lines	1.00%
	Rolled back transactions	1.00%
	Average items per order	10.00
Payment	Home warehouse	85.01%
	Remote warehouse	14.99%
	Accessed by last name	60.01%
Order Status	Accessed by last name	60.05%
Delivery	Skipped transactions	0
Transaction Mix	New Order	44.915%
	Payment	43.020%
	Order status	4.020%
	Delivery	4.025%
	Stock level	4.020%

## Checkpoint

*The number of checkpoints in the Measurement Interval, the time in seconds from the start of the Measurement Interval to the first checkpoint, and the Checkpoint Interval must be disclosed.*

Oracle database was performed checkpoints at log switches. The database log files were sized such that a log switch would occur approximately every 29 minutes at the desired throughput. One complete checkpoint occurred and a second checkpoint started during the warm-up period. The checkpoint that was started in warm up completed, and four complete checkpoints occurred during the measurement period.

---

## RTE Descriptions

*If the RTE is commercially available, then its inputs must be specified. Otherwise, a description must be supplied of what inputs (e.g., scripts) to the RTE had been used.*

PRTE Software was used to simulate terminal users, generate random data and record response times. This package ran on systems that are distinct from the system under test. PRTE command file used is included in Appendix A.

## Emulated Components

*It must be demonstrated that the functionality and performance of the components being emulated in the Driver System are equivalent to the priced system. The results of the test described in Clause 6.6.3.4 must be disclosed.*

Due to the large number of PCs and associated hardware that would be required to run these tests, Remote Terminal Emulator was used to emulate the connected PCs and LAN. As configured for this test, the driver software emulates the traffic that would be observed from the users' PCs connected by Ethernet to the front-end clients using HTTP (HyperText Transfer Protocol) over TCP/IP.

The driver system consisted of 4 ProLiant DL580 servers.

## Functional Diagrams

*A complete functional diagram of both the benchmark configuration and the configuration of the proposed (target) system must be disclosed. A detailed list of all hardware and software functionality being performed on the Driver System and its interface to the SUT must be disclosed.*

The diagram in Section 1 shows the tested and priced benchmark configurations.

## Networks

*The network configuration of both the tested services and proposed (target) services which are being represented and a thorough explanation of exactly which parts of the proposed configuration are being replaced with the Driver System must be disclosed.*

*The bandwidth of the networks used in the tested/priced configuration must be disclosed.*

Section 1 of this report contains detailed diagrams of both the benchmark configuration and the priced configuration. In the tested configuration, the server system and two client systems were connected to each other directly.

The drivers systems and client systems were connected using another 1000BaseT Ethernet switch.

## Operator Intervention

*If the configuration requires operator intervention (see Clause 6.6.6), the mechanism and the frequency of this intervention must be disclosed.*

This configuration does not require any operator intervention to sustain eight hours of the reported throughput.

# Clause 7 Related Items

---

## System Pricing

A detailed list of hardware and software used in the priced system must be reported. Each separately orderable item must have vendor part number, description, and release/revision level, and either general availability status or committed delivery date. If package-pricing is used, vendor part number of the package and a description uniquely identifying each of the components of the package must be disclosed. Pricing source and effective date(s) of price(s) must also be reported.

The total 3 year price of the entire configuration must be reported, including: hardware, software, and maintenance charges. Separate component pricing is recommended. The basis of all discounts used must be disclosed.

The details of the hardware and software are reported in the front of this report as part of the executive summary. All third party quotations are included at the end of this report as Appendix D.

## Availability, Throughput, and Price Performance

The committed delivery date for general availability (availability date) of products used in the price calculation must be reported. When the priced system includes products with different availability dates, the reported availability date for the priced system must be the date at which all components are committed to be available.

A statement of the measured tpmC as well as the respective calculations for the 3-year pricing, price/performance (price/tpmC), and the availability date must be included.

- **Maximum Qualified Throughput 102,454 tpmC**
- **Price per tpmC \$0.73 USD per tpmC**
- **Available December 31, 2007**

## Country Specific Pricing

Additional Clause 7 related items may be included in the Full Disclosure Report for each country specific priced configuration. Country specific pricing is subject to Clause 7.1.7

This system is being priced for the United States of America.

## Usage Pricing

For any usage pricing, the sponsor must disclose:

- Usage level at which the component was priced.
- A statement of the company policy allowing such pricing.

The component pricing based on usage is shown below:

- Oracle Database 11g Standard Edition One.
- Microsoft Windows 2003 SP 1 R2 Server.

## **Auditor's Report**

*The auditor's name, address, phone number, and a copy of the auditor's attestation letter indicating compliance must be included in the Full Disclosure Report.*

This implementation of the TPC Benchmark C was audited by Lorna Livingtree of Performance Metrics Inc.

Performance Metrics, Inc. PO Box 984, Klamath, CA 95548  
phone: 707-482-0523 fax: 707-482-0575 email: [lornal@perfmetrics.com](mailto:lornal@perfmetrics.com)

September 7, 2007

Mr. Bryon Georgson  
Database Performance Engineer  
Hewlett-Packard Company  
20555 SH 249  
Houston, TX 77070

I have verified by remote the TPC Benchmark™ C for the following configuration:

Platform: HP Proliant ML350 G5  
Database Manager: Oracle 11g Standard Edition One for Windows x64  
Operating System: Microsoft(R) Windows(R) Server 2003 Standard x64 Edition  
Transaction Monitor: Microsoft COM+

System Under Test:				
CPU's	Memory	Disks (total)	90% Response	TpmC
1 Intel Xeon quad core @ 2.6 Ghz	Main: 24 GB	100 @ 36 GB 4 @ 146 GB 1 @ 36 GB	0.26	102,454

In my opinion, these performance results were produced in compliance with the TPC requirements for the benchmark. The following attributes of the benchmark were given special attention:

- The transactions were correctly implemented.
- The database files were properly sized.
- The database was properly scaled with 8,500 warehouses, 8100 of which were active during the measured interval.
- The ACID properties were successfully demonstrated.
- The durable media failure was demonstrated on the full configuration but using only 40,500 active users.
- Input data was generated according to the specified percentages.
- Eight hours of mirrored log space was present on the tested system.
- Eight hours of growth space for the dynamic tables was present on the tested system.
- The data for the 60 days space calculation was verified.
- The steady state portion of the test was 127 minutes.
- There was one complete checkpoint in steady state before the measured interval.
- There were 4 checkpoints started and completed inside the measured interval.
- The system pricing was checked for major components and maintenance.
- Third party quotes were verified for compliance.

Auditor Notes: None

Sincerely,

*Lorna Livingtree*

Lorna Livingtree  
Auditor

**
** Author:
**
** Bill Carr
**
** Revisions:
**
** 10/04/95 WCarr
** - Original
**
**
*/

#ifdef HISTORY

02-Jun-97 WCarr Removed use of Mutex objects in favor of critical
sections. These prove to be at least one order of
magnitude faster.

31-Oct-97 WCarr Fixed a buffer wrap problem where if the data
were
to end exactly on the buffer end, the code would
not wrap to the beginning.

Also added code that causes a writer to block if
there is no room to write in data. Fixed the
timeout code so that a non-blocking read or write
can function.

06-Nov-97 WCarr Modified APIs to allow the read and write
operations
to supply the timeout values.

Fixed a bug where the critical section was not
released when a buffer read or write operation
timed out.

#
# TPCC USER NETWORK VARIABLES #
#
#####
# TPCC_USER_LOG_TYPE controls what information the prte users log
# to thier
# respective files. This is a bit mask.
#
# 0 - no logging
# 1 - timer logging (required for asci data
# reduction)
# 2 - sut data logging (required for durability)
# 4 - script logging (required by the tpcc user
# script)
# 8 - user sut data logging (required by web
# users for
# error checking)
#
# In general, leave this at 12 for web clients
# doing binary
# data reduction, and 13 for web clients doing
# asci data
# reduction.
#
# TPCC_USER_FLUSH_LOG is whether or not to flush every write to the
# log.
#
# DURABILITY_LOGGING is whether or not to parse new order response
# pages for
# durability data (to be sent to reducer). This
# variable
# is a boolean so legal values are 0,f,F and 1,t,T.
#
# C_LAST is the constant value used for customer last names.
# This value must be chosen with care. It must be based on
# the value you used when populating your database.

#####
#
# TEST CONTROL NETWORK VARIABLES #
#
#####
#
# LOOPBACK_MODE
# 0 - Full end-to-end runs.
# 1 - Back end loopback runs (not implemented yet)
# 2 - Front end loopback runs
# 3 - RTE loopback runs
#
# RUN_NUMBER is used to tag all output files with the run
# number.
#
# 1 - the primary measurement run.
# 2 - the repeatability run.
# 5 - the 50% run.
# 8 - the 80% run.
#
# If you are unsure which run this really will
# end up being,

```

```

# just leave it at 1, and you can rename files
# later if you need to.
#
# VERSION_NUMBER is used to tag all output files with the
# version number. This is used if you submit files to the
# auditor, and then need to rerun the test, and resubmit files to
# the auditor, for some reason. For example, you submit a
# repeatability run (RUN_NUMBER 2, VERSION_NUMBER 1) and the
# auditor finds a problem and asks you to re-run the test
# (RUN_NUMBER 1, VERSION_NUMBER 2).
# Under normal circumstances, this can just be
# left at 1.
#
# TEST_RESULTS_DIR is the full directory path where the test's
# run directory will be created. All files (data, log, etc)
# will be put into the run directory.
#
# WARMUP_TIME is the time in seconds to warm up. This is
# the period of time after all users have started doing
# transactions and before the measurement interval begins.
#
# STEADY_STATE_TIME is the time for which the test is considered to
# be in a steady running state. It is during this time
# that all data for measurement intervals will be
# collected.
#
# MEASUREMENT_INTERVAL defines the length of a test period within
# the STEADY_STATE_TIME. The steady state time may have 1
# or more measurement intervals. Each measurement
# interval can be thought of as a separate measurement
# run.
#
# COOLDOWN_TIME is the length of time the test will continue
# to run after the measurement interval is over. This
# time can be used for doing various types of data
# collection by hand if desired that might otherwise have a
# negative impact on the measured test results. Even if
# you are not collecting any extra data by hand, it is
# recommended that you keep this value at something like
# 300 or 600 to avoid "clipping" effects at the end of the
# measurement interval.
#
# CHECKPOINT_INTERVAL is the total time between the start of each
# checkpoint command.
#
# CKPT_PROXIMITY_ADDITIONAL_OFFSET This value will be added to any
# required proximity time to give the actual start
# time of the first checkpoint in the measurement
# interval.
#
# LOGIN_DELAY is the delay between logins on a per front
# end basis. NOTE: This is similar to the prte internal
# variable resume_interval (tpcc users start, then
# immediately pause, so the act of logging in is just a
# resume) but not exactly the same.
#
# RESUME_DELAY is the delay between resumes on a per front
# end basis. NOTE: This is similar to the prte internal
# variable resume_interval but not exactly the same.
#
# STOP_DELAY is the delay between stops on a per front end
# basis. NOTE: This is similar to the prte internal
# variable stop_interval but not exactly the same.
#
# SYNC_OFFSET how many users we'll allow to have outstanding
# when doing crowd control.
#
# SYNC_UPDATE how often user login/resume/stop progress is
# printed out to the console (heartbeat of user synchronization
# effectively).
#

```

```

# MSG_TIMEOUT how long we'll wait for status and sync messages.
#

#####
#
# AUDIT UTILITIES -- these are the replacement for the audit
# shell scripts -- they currently only work for Oracle on DUNIX.
# They do the following:
# Collect logspace info
# Write data to audit table for later use in runcheck
# Collect checkpoint info
# Run optional custom scripts on back-end before or after the
# test
# For Oracle, collect bstat/estat (optional)
#
#####
#
# GET_ALL_AUDIT_FILES if True (or 1) will create the following:
# Audit table for doing runcheck later
# mllog.v1 -- a before & after snapshot of the logsize
#
# BE_NAMES Comma-separated list of back-ends
#
# BE_USERNAME Username to use when logging into back-ends
# NOTE: you must have .rhosts configured so no
# password is needed.
#
# DATABASE_TYPE Oracle, Sybase or MsSql
#
# DATABASE_USERNAME Username and password for database.
# DATABASE_PASSWORD Defaults are: tpcc/tpcc for Oracle and sa/<no-
# passwd>
# for Sybase and MsSql
#
# Optional variables -- if you don't want them, comment them out or
# set to ""
#
# ORACLE_STATS_SCRIPT_PATH
# Path to directory on back-end containing
# Oracle's
# orst_<xxx>.sql files.
# For example: $ORACLE_HOME/bench/gen/sql
#
# CUSTOM_BEFORE_TEST_SCRIPT
# CUSTOM_AFTER_TEST_SCRIPT
# Path of executable file on back-end to be run
# before/after
# the test. For example, if you wanted to run
# processor

```

```

#          affinity and load some stored procedures
before a test,
#          you could put the commands in a shell script
on the BE
#          and call put the path to that shell script
into the
#          CUSTOM_BEFORE_TEST_SCRIPT variable

System Information report written at: 09/12/07 09:59:27
System Name: BD1
[System Summary]

Item Value
OS Name Microsoft(R) Windows(R) Server 2003, Standard Edition
Version 5.2.3790 Service Pack 1 Build 3790
Other OS Description Not Available
OS Manufacturer Microsoft Corporation
System Name BD1
System Manufacturer HP
System Model ProLiant ML110 G4
System Type X86-based PC
Processor x86 Family 15 Model 6 Stepping 5 GenuineIntel ~2793 Mhz
Processor x86 Family 15 Model 6 Stepping 5 GenuineIntel ~2793 Mhz
BIOS Version/Date HP 010, 3/5/2007
SMBIOS Version 2.4
Windows Directory C:\WINDOWS
System Directory C:\WINDOWS\system32
Boot Device \Device\HarddiskVolume1
Locale United States
Hardware Abstraction Layer Version = "5.2.3790.1830
(srv03_spl_rtm.050324-1447)"
User Name BD1\Administrator
Time Zone Central Daylight Time
Total Physical Memory 1,022.05 MB
Available Physical Memory 679.06 MB
Total Virtual Memory 2.91 GB
Available Virtual Memory 2.72 GB
Page File Space 2.00 GB
Page File C:\pagefile.sys

System Name: BD2
[System Summary]

```

```

Item Value
OS Name Microsoft(R) Windows(R) Server 2003, Standard Edition
Version 5.2.3790 Service Pack 1 Build 3790
Other OS Description Not Available
OS Manufacturer Microsoft Corporation
System Name BD2
System Manufacturer HP
System Model ProLiant ML110 G4
System Type X86-based PC
Processor x86 Family 15 Model 6 Stepping 5 GenuineIntel ~2793 Mhz
Processor x86 Family 15 Model 6 Stepping 5 GenuineIntel ~2793 Mhz
BIOS Version/Date HP 010, 3/5/2007
SMBIOS Version 2.4
Windows Directory C:\WINDOWS
System Directory C:\WINDOWS\system32
Boot Device \Device\HarddiskVolume1
Locale United States
Hardware Abstraction Layer Version = "5.2.3790.1830
(srv03_spl_rtm.050324-1447)"
User Name BD2\Administrator
Time Zone Central Daylight Time
Total Physical Memory 1,022.05 MB
Available Physical Memory 689.23 MB
Total Virtual Memory 2.91 GB
Available Virtual Memory 2.73 GB
Page File Space 2.00 GB
Page File C:\pagefile.sys

-----  
HP Specific Drivers  
-----

The following Microsoft Windows 2003 Server device drivers were replaced with HP-specific device drivers:  
The Microsoft HP Smart Array P800/512MB SAS Controller Controller default device driver (hpcisss.SYS) was replaced with the HP Smart Array P800/512MB SAS Controller Non-miniport Performance Drivers for Microsoft Windows 2003 Server (hpgcissb.sys and hpgcissd.sys).

### 3' Green Cat 5e patch cable

Item #	415-5003
Your Price:	\$1.25
<input type="button" value="Add to Cart"/>	<input type="button" value="Email to a Friend"/>

Cat 5e Molded Patch Cable.

Category 5 Enhanced high speed cabling is a pre-requisite for today's performance demanding Ethernet and gigabit networks. Graycables.com will keep you at the head of the pack with our high performance 350MHz Cat5E patch cables. Our Cat5e 350MHz patch cables easily handle bandwidth intensive applications and more. With the UL certified patch cables that meet all the TIA/EIA standards. Graycables' Enhanced Cat5 patch cables are well constructed using Enhanced Cat5e bulk cable, which consists of 4 unshielded twisted pairs, 24 AWG. stranded conductors, and a PVC jacket. We terminate the non-booted Enhanced Cat5e cables with RJ45 plugs, which are plated with 50 microns of gold plating per contact. We terminate the snagless molded booted Enhanced Cat5e cables with Cat5E certified RJ45 plugs, which are plated with 50 microns of gold plating per contact. Constructed with high-quality wire and a shortened body plug will keep Near-end Crosstalk (NEXT) levels to a minimum. Our molded, snagless boot prevents unwanted cable snags during installation/maintenance and provides extra strain-relief.

**About Category 5e (CAT 5e), or Enhanced Category 5:**

Ratified in 1999, it's an incremental improvement designed to enable cabling to support full-duplex Fast Ethernet operation and Gigabit Ethernet. This Cat5e Molded Patch cable will be used to connect all the hardware destinations in a local area network. The cable will ensure a clear transmission and snagless-type moldings to protect the connection.

The main differences between Category 5 and Category 5e can be found in the specifications. The performance requirements have been raised slightly in the new standard. CAT5e has stricter specifications for PS-ELFEXT (Power Sum Equal-Level Far-End Crosstalk), NEXT (Near-End Crosstalk), Attenuation, and Return Loss (RL) than those for Category 5. Like CAT 5, CAT5e is a 100-MHz standard, but it has the capacity to handle bandwidth superior to that of CAT5. With these improvements, you can expect problem-free, full-duplex, 4-pair Ethernet transmissions over your CAT5e UTP.

**Cat 5E Specifications:**

- Frequency 100 MHz. Attenuation (Min. at 100 MHz) 22 dB.
- Characteristic Impedance 100 ohms @ 15%.
- NEXT (Min. at 100 MHz) 35.3 dB.
- PS-NEXT (Min. at 100 MHz) 32.3 dB.
- ELFEXT (Min. at 100 MHz) 32.3 dB.
- PS-ELFEXT (Min. at 100 MHz) 20.8 dB.
- Return Loss (Min. at 100 MHz) 20.1 dB.
- Delay Skew (Max. per 100 m) 45 ns.

**Graycables.com Requirements:**

- Conductor: 4-pair 24 AWG Stranded Copper

Part number: NW0099  
Mfg Part No.: MG4

**Our Price:**  
**\$65.99**

**Description**

MG4 v2.0 is an electronic Keyboard/Video/Mouse (KVM) switch that controls up to 4 PC's using a single key save you money by eliminating redundant peripherals (e.g. keyboards, monitors, and mice) and provide a cost small investment in MG4 v2.0, you can preserve precious office space, cut energy cost and redundant periprt v2.0 features intelligent mouse and keyboard emulation to ensure successful PC boot up and flawless operat Lock status are recorded and restored while switching among PCs. Users can select desired PC by using Hc the MG4 v2.0 do the automatic scan.

Specifications	
KVM Type	Keyboard / Video / Mouse - Switch
Port Selection Method	Hot Key + Button
Max Video Resolution	1600 x 1200 pixels
Additional Features	Scrolling Mouse Support • Mouse and Keyboard Emulation
No. of Computers Controlled	4
No. of Consoles	1
Video / Monitor Connector	HDB 15-pin
Mouse Connector	PS/2
Keyboard Connector	PS/2
Width	4.5 in.
Length	7.5 in.
Height	2 in.
Weight	5 lb.
Warranty	1 Year
MPN	MG4KVM SWITCHES
Product ID	25278573

215.9 x 279.4 mm
