First Edition – December 8, 2003

Hewlett Packard Company (HP) believes that the information in this document is accurate as of the publication date. The information in this document is subject to change without notice. HP assumes no responsibility for any errors that may appear in this document. The pricing information in this document is believed to accurately reflect the current prices as of the publication date. However, HP provides no warranty of the pricing information in this document.

Benchmark results are highly dependent upon workload, specific application requirements, and system design and implementation. Relative system performance will vary as a result of these and other factors. Therefore, TPC Benchmark C should not be used as a substitute for a specific customer application benchmark when critical capacity planning and/or product evaluation decisions are contemplated.

All performance data contained in this report were obtained in a rigorously controlled environment. Results obtained in other operating environments may vary significantly. HP does not warrant or represent that a user can or will achieve similar performance expressed in transactions per minute (tpmC) or normalized price/performance (\$/tpmC). No warranty of system performance or price/performance is expressed or implied in this report.

Preface

The TPC Benchmark C was developed by the Transaction Processing Performance Council (TPC). The TPC was founded to define transaction processing benchmarks and to disseminate objective, verifiable performance data to the industry. This full disclosure report is based on the TPC Benchmark C Standard Specifications Version 5.0, released March 7, 2001.

TPC Benchmark C Overview

The TPC describes this benchmark in Clause 0.1 of the specifications as follows:

TPC Benchmark C is an On Line Transaction Processing (OLTP) workload. It is a mixture of read-only and update intensive transactions that simulate the activities found in complex OLTP application environments. It does so by exercising a breadth of system components associated with such environments, which are characterized by:

- The simultaneous execution of multiple transaction types that span a breadth of complexity
- On-line and deferred transaction execution modes
- Multiple on-line terminal sessions
- Moderate system and application execution time
- Significant disk input/output
- Transaction integrity (ACID properties)
- Non-uniform distribution of data access through primary and secondary keys
- Databases consisting of many tables with a wide variety of sizes, attributes, and relationships
- Contention of data access and update

The performance metric reported by TPC-C is a “business throughput” measuring the number of orders processed per minute. Multiple transactions are used to simulate the business activity of processing an order, and each transaction is subject to a response time constraint. The performance metric for this benchmark is expressed in transactions-per-minute-C (tpmC). To be compliant with the TPC-C standard, all references to tpmC results must include the tpmC rate, the associated price-per-tpmC, and the availability date of the priced configuration.

TPC-C uses terminology and metrics that are similar to other benchmarks, originated by the TPC or others. Such similarity in terminology does not in any way imply that TPC-C results are comparable to other benchmarks. The only benchmark results comparable to TPC-C are other TPC-C results conformant with the same revision.

Despite the fact that this benchmark offers a rich environment that emulates many OLTP applications, this benchmark does not reflect the entire range of OLTP requirements. In addition, the extent to which a customer can achieve the results reported by a vendor is highly dependent on how closely TPC-C approximates the customer application. The relative performance of systems derived from this benchmark does not necessarily hold for other workloads or environments. Extrapolations to other environments are not recommended.

Benchmark results are highly dependent upon workload, specific application requirements, and systems design and implementation. Relative system performance will vary as a result of these and other factors. Therefore, TPC-C should not be used as a substitute for a specific customer application benchmark when critical capacity planning and/or product evaluation decisions are contemplated.

Abstract

Overview

This report documents the methodology and results of the TPC Benchmark C test conducted on the HP Integrity rx5670 Cluster 64P. The operating system used for the benchmark was Red Hat Enterprise Linux AS 3 . The DBMS used was Oracle Database 10g Enterprise Edition with Real Application Cluster and Partitioning.

TPC Benchmark C Metrics

The standard TPC Benchmark C metrics, tpmC (transactions per minute), price per tpmC (three year capital cost per measured tpmC), and the availability date are reported as:

Maximum Qualified Throughput - 1184893.38 tpmC
Price per tpmC - \$5.42 per tpmC
Available - April 30, 2004, Hardware Available Now.

Standard and Executive Summary Statements

The following pages contain an executive summary of results for this benchmark.

Auditorb

The benchmark configuration, environment and methodology were audited by Lorna Livingtree of Performance Metrics Inc. to verify compliance with the relevant TPC specifications.

Prices used in TPC benchmarks reflect the actual prices a customer would pay for a one-time purchase of the stated components. Individually negotiated discounts are not permitted. Special prices based on assumptions about past or future purchases are not permitted. All discounts reflect standard pricing policies for the listed components. For complete details, see the pricing sections of the TPC benchmark specifications. If you find that the stated prices are not available according to these terms, please inform the TPC at pricing@tpc.org. Results independently audited by Lorna Livingtree of Performance Metrics Inc. Thank you.

General Items

Application Code and Definition Statements

The application program (as defined in clause 2.1.7) must be disclosed. This includes, but is not limited to, the code implementing the five transactions and the terminal input output functions.

Appendix A contains all source code implemented in this benchmark.

Test Sponsor

A statement identifying the benchmark sponsor(s) and other participating companies must be provided.

This benchmark was sponsored by Hewlett Packard Company. The benchmark was developed and engineered by Hewlett Packard Company and Oracle Corporation. Testing took place at HP Database Performance Engineering Laboratory in Houston, Texas.

Parameter Settings

Settings must be provided for all customer-tunable parameters and options which have been changed from the defaults found in actual products, including by not limited to:

- *Database options*
- *Recover/commit options*
- *Consistency locking options*
- *Operating system and application configuration parameters*

This requirement can be satisfied by providing a full list of all parameters.

Appendix C contains the tunable parameters for the database, the operating system, and the transaction monitor.

Configuration Items

Diagrams of both measured and priced configurations must be provided, accompanied by a description of the differences.

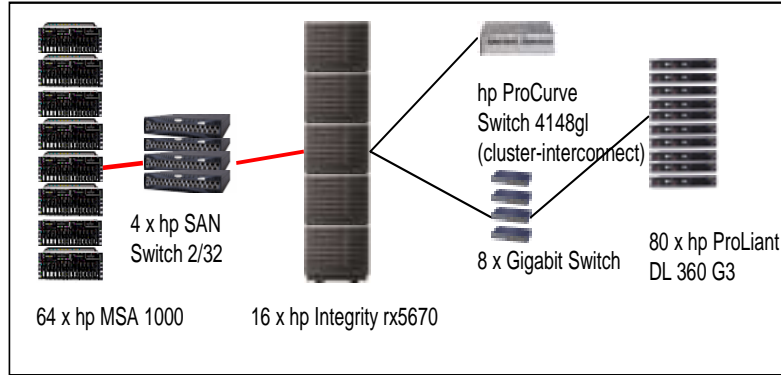

The configuration diagram for both the tested and priced system are the same and included on the following page

Figure 1. Benchmarked and Priced Configuration

19 hp Rack 9142s containing:

- 16 x hp Integrity rx5670
- 4 x hp StorageWorks SAN Switch 2/32
- 1 x hp ProCurve 4148gl
- 64 x hp StorageWorks MSA1000
- 96 x hp StoragWorks 4314R
- 80 x hp ProLiant DL360G3

Clause 1 Related Items

Table Definitions

Listing must be provided for all table definition statements and all other statements used to set up the database. Appendix B contains the code used to define and load the database tables.

Physical Organization of Database

The physical organization of tables and indices within the database must be disclosed.

The hp Integrity rx5670 Cluster 64P consisted of 16 servers. An hp ProCurve Switch 4148gl, Gigabit Ethernet Switch, was used as cluster interconnect. The servers had four hp StorageWorks fca 2214 2GB PCI-X fibre channel HBAs connected to hp StorageWorks SAN Switch 2/32s. Each of the hp StorageWorks SAN Switch 2/32 had 12 hp StorageWorks MSA1000s with two StorageWorks Enclosure 4314Rs each (total of 42 disks per MSA 1000) – for data and indexes; and four hp StorageWorks MSA1000s (14 disk drives per MSA1000) – for redo logs and icust1 and istok indexes.

There were 672 x 18GB15krpm HDD Ultra320 HP, 1344 x 36GB15krpm HDD Ultra320 HP and 224 x 146GB 10krpm HDD Ultra320 HP in the benchmarked configuration.

Redo log files were protected from single point failures by placing the redo log file group members on different StorageWorks MSA1000s.

Array accelerator cache was set to 100% write on hp StorageWorks MSA1000s.

Following chart details the physical organization of the SAN and database.

HBA	SAN Switch	MSAarray	Number of HDD	Capacity (GB)	Array Size (GB)	RAID 0 Volumes	Contents

Priced Configuration:

All hardware and software remained the same between the benchmarked and priced configurations.

Insert and Delete Operations

It must be ascertained that insert and/or delete operations to any of the tables can occur concurrently with the TPC-C transaction mix. Furthermore, any restrictions in the SUT database implementation that precludes inserts beyond the limits defined in Clause 1.4.11 must be disclosed. This includes the maximum number of rows that can be inserted and the minimum key value for these new rows.

All insert and delete functions were verified to be fully operational during the entire benchmark.

Partitioning

While there are a few restrictions placed upon horizontal or vertical partitioning of tables and rows in the TPC-C benchmark, any such partitioning must be disclosed.

Horizontal partitioning was used for history table.

Replication, Duplication or Additions

Replication of tables, if used, must be disclosed. Additional and/or duplicated attributes in any table must be disclosed along with a statement on the impact on performance.

No replications, duplications or additional attributes were used in this benchmark.

Clause 2 Related Items

Random Number Generation

The method of verification for the random number generation must be described.

Random numbers were generated using the drand48() and lrand48() UNIX calls. These functions generate pseudo random numbers using the linear congruential algorithm and 48-bit integer arithmetic. The random number generators are initially seeded using the srand48() call.

Input/Output Screen Layout

The actual layout of the terminal input/output screens must be disclosed.

All screen layouts followed the specifications exactly.

Priced Terminal Feature Verification

The method used to verify that the emulated terminals provide all the features described in Clause 2.2.2.4 must be explained. Although not specifically priced, the type and model of the terminals used for the demonstration in 8.1.3.3 must be disclosed and commercially available (including supporting software and maintenance).

The terminal attributes were verified by the auditor manually exercising each specification on a representative ProLiant DL360R.

Presentation Manager or Intelligent Terminal

Any usage of presentation managers or intelligent terminals must be explained.

Application code running on the client machines implemented the TPC-C user interface. No presentation manager software or intelligent terminal features were used. The source code for the forms applications is listed in Appendix A.

Transaction Statistics

Table 2.1 lists the numerical quantities that Clauses 8.1.3.5 to 8.1.3.11 require.

Table 2. 1 Transaction Statistics

Statistic		Value
New Order	Home warehouse order lines	99.00%
	Remote warehouse order lines	1.00%
	Rolled back transactions	1.00%
	Average items per order	10.00
Payment	Home warehouse	85.00%
	Remote warehouse	15.00%
	Accessed by last name	60.01%
Order Status	Accessed by last name	59.99%
Delivery	Skipped transactions	None
Transaction Mix	New Order	44.911%
	Payment	43.023%
	Order status	4.020%
	Delivery	4.026%
	Stock level	4.021%

Queuing Mechanism

The queuing mechanism used to defer the execution of the Delivery transaction must be disclosed.

BEA Tuxedo on each client system served as the queuing mechanism to the database. Each delivery request was submitted to BEA Tuxedo asynchronously with control being returned to the client process immediately and the deferred delivery part completing asynchronously.

Clause 3 Related Items

Transaction System Properties (ACID)

The results of the ACID tests must be disclosed along with a description of how the ACID requirements were met. This includes disclosing which case was followed for the execution of Isolation Test 7.

All ACID property tests were successful. The executions are described below.

Atomicity

The system under test must guarantee that the database transactions are atomic; the system will either perform all individual operations on the data or will assure that no partially completed operations leave any effects on the data.

Completed Transactions

A row was randomly selected from the warehouse, district and customer tables, and the balances noted. A payment transaction was started with the same warehouse, district and customer identifiers and a known amount. The payment transaction was committed and the rows were verified to contain correctly updated balances.

Aborted Transactions

A row was randomly selected from the warehouse, district and customer tables, and the balances noted. A payment transaction was started with the same warehouse, district and customer identifiers and a known amount. The payment transaction was rolled back and the rows were verified to contain the original balances.

Consistency

Consistency is the property of the application that requires any execution of a database transaction to take the database from one consistent state to another, assuming that the database is initially in a consistent state.

Consistency conditions one through four were tested using a shell script to issue queries to the database. The results of the queries verified that the database was consistent for all four tests.

A run was executed under full load over two hours with checkpoints.

The shell script was executed again. The result of the same queries verified that the database remained consistent after the run.

Isolation

Sufficient conditions must be enabled at either the system or application level to ensure the required isolation defined above (clause 3.4.1) is obtained.

Isolation tests one through nine were executed using shell scripts to issue queries to the database. Each included timestamps to demonstrate the concurrency of operations. The results of the queries were captured to files. The captured files were verified by the auditor to demonstrate the required isolation had been met.

Durability

The tested system must guarantee durability: the ability to preserve the effects of committed transaction and insure database consistency after recovery from any one of the failures listed in Clause 3.5.3.

Durable Media Failure

Durability from media failure was demonstrated on a database scaled for 16002 warehouses. The standard driving mechanism was used to generate the transaction load of 160020 users. The fully scaled database under full load would also have passed the following test.

Loss of Data

To demonstrate recovery from a permanent failure of durable medium containing TPC-C tables, the following steps were executed:

1. A partition on a disk was backed up.
2. The total number of New Orders was determined by the sum of D_NEXT_O_ID of all rows in the DISTRICT table giving the beginning count. Consistency check 3 was verified before run.
3. The RTE was started with 160020 users
4. The test was allowed to run for a minimum of 10 minutes.
5. The backed up partition was overwritten with garbage information.
6. Oracle10g recorded errors about corrupt data on the partition. The database and the RTE were then shut down.
7. The database partition which was backed up in Step 1 was restored.
8. The database was then started. The database was recovered using the recover command from SQLPLUS. The database was opened and Oracle 10g performed instance recovery.
9. Consistency conditions were executed and verified.
10. Step 2 was repeated and the difference between the first and second counts was noted.
11. An RTE report was generated for the entire run time giving the number of NEW-ORDERS successfully returned to the RTE.
12. The counts in step 9 and 10 were compared and the results verified that all committed transactions had been successfully recovered.
13. Samples were taken from the RTE files and used to query the database to demonstrate successful transactions had corresponding rows in the ORDER table.

Loss of Log

To demonstrate recovery from a permanent failure of durable medium containing TPC-C tables, the following steps were executed:

1. The total number of New Orders was determined by the sum of D_NEXT_O_ID of all rows in the DISTRICT table giving the beginning count. Consistency check 3 was verified before run.
2. The RTE was started with 160020 users.
3. The test was allowed to run for a minimum of 10 minutes.
4. A disk drive from a StorageWorks MSA1000 containing redo log files was removed. Oracle10g reported write errors on one of the redo file group members and closed it, and continued running because the other member of the redo file group resided on a different StorageWorks MSA 1000.
5. The database and the RTE were then shut down.
6. The database was then started. Consistency conditions were executed and verified.
7. Step 1 was repeated and the difference between the first and second counts was noted.
8. An RTE report was generated for the entire run time giving the number of NEW-ORDERS successfully returned to the RTE.
9. The counts in step 7 and 8 were compared and the results verified that all committed transactions had been successfully recovered.
10. Samples were taken from the RTE files and used to query the database to demonstrate successful transactions had corresponding rows in the ORDER table.

Instantaneous Interruption, Loss of Memory

Because loss of power erases the contents of memory, the instantaneous interruption and the loss of memory tests were combined into a single test. This test was executed on a fully scaled database of 128016 warehouses under a full load of 1280160 users. The following steps were executed:

1. The total number of New Orders was determined by the sum of D_NEXT_O_ID of all rows in the DISTRICT table giving the beginning count.
2. The RTE was started with 1280160 users.
3. The test was allowed to run for a minimum of 10 minutes.
4. A checkpoint was issued.
5. Upon completion of the checkpoint a system crash and loss of memory were induced by turning all six of the computers in the cluster off. No battery backup or Uninterruptible Power Supply (UPS) were used to preserve the contents of memory.
6. The RTE was shutdown.
7. Power was restored.
8. Oracle10g was restarted from one of the nodes and performed an automatic recovery.
9. Consistency conditions were executed and verified.
10. Step 1 was repeated and the difference between the first and second counts was noted.
11. An RTE report was generated for the entire run time giving the number of NEW-ORDERS successfully returned to the RTE.
12. The counts in step 9 and 10 were compared and the results verified that all committed transactions had been successfully recovered.
13. Samples were taken from the RTE files and used to query the database to demonstrate successful transactions had corresponding rows in the ORDER table.

Instantaneous Interruption, Loss of One Node of the Cluster

To demonstrate recovery from one of node of the cluster , the following steps were executed:

1. The total number of New Orders was determined by the sum of D_NEXT_O_ID of all rows in the DISTRICT table giving the beginning count.
2. The RTE was started with 1280160 users.
3. The test was allowed to run for a minimum of 10 minutes.
4. A checkpoint was issued.
5. Upon completion of the checkpoint one of the nodes was turned off.
6. The RTE was shutdown, and Oracle10g was shutdown on rest of the nodes.
7. Oracle10g was restarted from one of the nodes and performed an automatic recovery.
8. Consistency conditions were executed and verified.
9. Step 1 was repeated and the difference between the first and second counts was noted.
10. An RTE report was generated for the entire run time giving the number of NEW-ORDERS successfully returned to the RTE.
11. The counts in step 9 and 10 were compared and the results verified that all committed transactions had been successfully recovered.
12. Samples were taken from the RTE files and used to query the database to demonstrate successful transactions had corresponding rows in the ORDER table.

Instantaneous Interruption, Loss of Cluster interconnect

To demonstrate recovery from cluster interconnect loss, the following steps were executed:

1. The total number of New Orders was determined by the sum of D_NEXT_O_ID of all rows in the DISTRICT table giving the beginning count.
2. The RTE was started with 1280160 users.
3. The test was allowed to run for a minimum of 10 minutes.
4. A checkpoint was issued.
5. Upon completion of the checkpoint the cluster interconnect switch was turned off. The cluster manger and Oracle10g terminated on all the nodes as connection to servers was down.
6. The RTE was shutdown.
7. Power was restored on the interconnect switch.
8. Oracle10g was restarted from one of the nodes and performed an automatic recovery.
9. Consistency conditions were executed and verified.
10. Step 1 was repeated and the difference between the first and second counts was noted.
11. An RTE report was generated for the entire run time giving the number of NEW-ORDERS successfully returned to the RTE.
12. The counts in step 9 and 10 were compared and the results verified that all committed transactions had been successfully recovered.
13. Samples were taken from the RTE files and used to query the database to demonstrate successful transactions had corresponding rows in the ORDER table.

Clause 4 Related Items

Initial Cardinality of Tables

The cardinality (e.g. number of rows) of each table, as it existed at the start of the benchmark run, must be disclosed. If the database was over-scaled and inactive rows of the WAREHOUSE table were deleted, the cardinality of the WAREHOUSE table as initially configured and the number of rows deleted must be disclosed.

Table 4.1 Number of Rows for Server

Table	Occurrences
Warehouse	128016
District	1280160
Customer	3840480000
History	3840480000
Order	3840480000
New Order	1152144000
Order Line	38405130752
Stock	12801600000
Item	100000
Unused Warehouses	0

Database Layout

The distribution of tables and logs across all media must be explicitly depicted for tested and priced systems.

The hp Integrity rx5670 Cluster 64P consisted of 16 servers. An hp ProCurve Switch 4148gl, Gigabit Ethernet Switch, was used as cluster interconnect. The servers had four hp StorageWorks fca 2214 2GB PCI-X fibre channel HBAs connecting to hp StorageWorks SAN Switch 2/32s. Each of the hp StorageWorks SAN Switch 2/32 had 12 hp StorageWorks MSA1000s with two StorageWorks Enclosure 4314Rs each (total of 42 disks per MSA 1000) – for data and indexes; and four hp StorageWorks MSA1000s (14 disk drives per MSA1000) – for redo logs and icust1 and istok indexes.

There were 672 x 18GB15krpm HDD Ultra320 HP, 1344 x 36GB15krpm HDD Ultra320 HP and 224 x 146GB 10krpm HDD Ultra320 HP in the benchmarked configuration.

Redo log files were protected from single point failures by placing the redo log file group members on different StorageWorks MSA1000s.

Array accelerator cache was set to 100% write on hp StorageWorks MSA1000s.

Section 1.2 of this report details the distribution of database tables and redo log files. The code that creates the database and tables are included in Appendix B.

Type of Database

A statement must be provided that describes:

1. The data model implemented by DBMS used (e.g. relational, network, hierarchical).
2. The database interface (e.g. embedded, call level) and access language (e.g. SQL, DL/1, COBOL read/write used to implement the TPC-C transaction. If more than one interface/access language is used to implement TPC-C, each interface/access language must be described and a list of which interface/access language is used with which transaction type must be disclosed.

Oracle Database 10g Enterprise Edition with Real Application Cluster and Partitioning is a relational DBMS.

Anonymous block PL/SQL and stored procedures were accessed through the ORACLE Call Interface. Application code is included in Appendix A.

Database Mapping

The mapping of database partitions/replications must be explicitly described.

The database was not replicated. The tables were not partitioned.

60 Day Space

Details of the 60 day space computations along with proof that the database is configured to sustain 8 hours of growth for the dynamic tables (Order, Order-Line, and History) must be disclosed.

Throughput

Measured tpmC must be reported

Maximum Qualified Throughput - 1184893.38 tpmC
Price per tpmC - \$5.42 per tpmC
Available - April 30, 2004, Hardware Available Now.

Response Times

Ninetieth percentile, maximum and average response times must be reported for all transaction types as well as for the menu response time.

Table 5.1: Response Times

Type	Average	Maximum	90th %
New-Order	2.435	76.474	4.908
Payment	1.227	67.072	2.551
Order-Status	1.621	39.809	3.297
Interactive Delivery	0.147	17.567	0.165
Deferred Delivery	0.258	20.676	0.555
Stock-Level	0.632	28.162	0.981
Menu	0.102	0.483	0.102

Keying and Think Times

The minimum, the average, and the maximum keying and think times must be reported for each transaction type.

Table 5.2: Keying Times

Type	Minimum	Average	Maximum
New-Order	18.005	18.008	18.035
Payment	3.010	3.019	3.052
Order-Status	2.010	2.019	2.045
Interactive Delivery	2.010	2.019	2.045
Stock-Level	2.010	2.019	2.045

Table 5.3: Think Times

Type	Minimum	Average	Maximum
New-Order	0.000	26.015	259.946
Payment	0.000	12.017	120.080
Order-Status	0.000	10.017	99.818
Interactive Delivery	0.000	5.025	50.130
Stock-Level	0.000	5.015	49.556

Response Time Frequency Distribution Curves and Other Graphs

Response Time frequency distribution curves (see Clause 5.6.1) must be reported for each transaction type.

The performance curve for response times versus throughput (see Clause 5.6.2) must be reported for the New-Order transaction.

Think Time frequency distribution curves (see Clause 5.6.3) must be reported for each transaction type.

Keying Time frequency distribution curves (see Clause 5.6.4) must be reported for each transaction type.

A graph of throughput versus elapsed time (see Clause 5.6.5) must be reported for the New-Order transaction.

Figure 5.1: Response Times Frequency Distribution for New Order Transactions

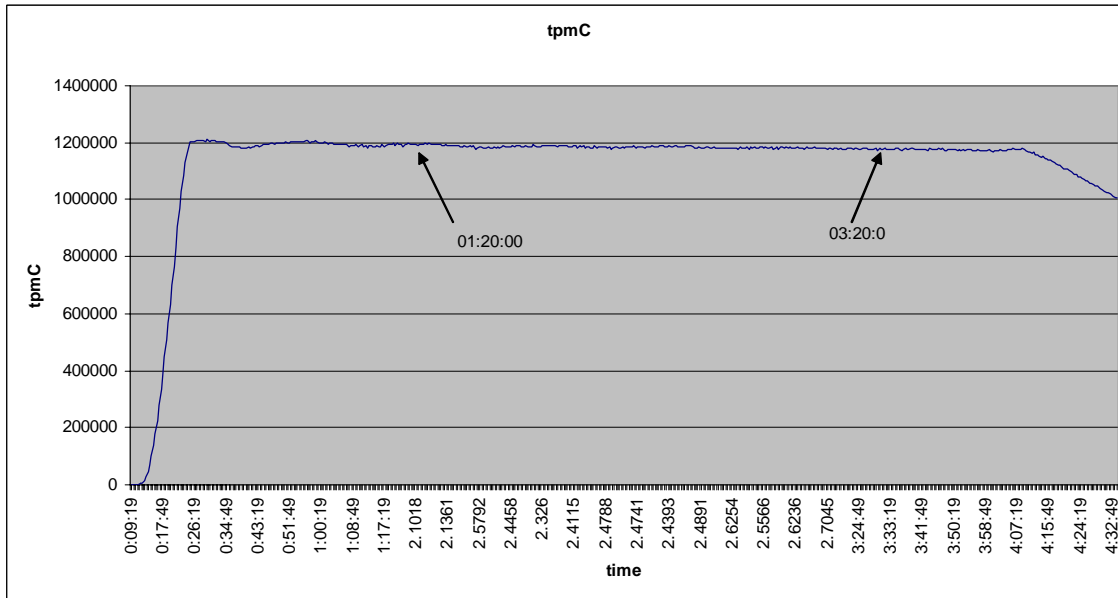

Figure 5.8: Throughput versus Time

Steady State Determination

The method used to determine that the SUT had reached a steady state prior to commencing the measurement interval must be disclosed.

Steady state was determined using real time monitor utilities from both the operating system and the RTE. Steady state was further confirmed by the throughput data collected during the run and graphed in Figure 5.8.

Work Performed During Steady State

A description of how the work normally performed during a sustained test (for example checkpointing, writing redo/undo log records, etc.) actually occurred during the measurement interval must be reported.

For each of the TPC Benchmark C transaction types, the following steps are executed. Each emulated user starts an Internet browser and asks to attach to the application on the desired client. The application formats the menus, input forms and data output using HTML (HyperText Markup Language). The HTML strings are transmitted over TCP/IP back to the client, where they can be displayed by any Web Browser software. The application on the client is run under the control of the Apache Web Server.

Transactions are submitted by the RTE in accordance with the rules of the TPC-C benchmark. The emulated user chooses a transaction from the menu. The RTE records the time it takes from selecting the menu item to receiving the requested form. Data is generated for input to the form, then the user waits the specified keying time. The submit is sent and the RTE records the time it takes for the transaction to be processed and all the output data to be returned. The user then waits for the randomly generated think time before starting the process over again. All timings taken by the RTE generate a start and end timestamp. Keying and think times are calculated as the difference between end-time of a timing to the start of the next.

The database records transactions in the database tables and the transaction log. Writes to the database may stay in Oracle's in-memory data cache for a while before being written to disk. LOG_CHECKPOINT_TIMEOUT parameter was used to control checkpointing, which specifies the amount of time, that has passed since the incremental checkpoint at the position where the last write to the redo log occurred. This parameter also signifies that no buffer will remain dirty (in the cache) for more than integer seconds.

Measurement Period Duration

A statement of the duration of the measurement interval for the reported Maximum Qualified Throughput (tpmC) must be included.

The reported measured interval was 7200 seconds.

Regulation of Transaction Mix

The method of regulation of the transaction mix (e.g., card decks or weighted random distribution) must be described. If weighted distribution is used and the RTE adjusts the weights associated with each transaction type, the maximum adjustments to the weight from the initial value must be disclosed.

The RTE was given a weighted random distribution, which could not be adjusted during the run.

Transaction Statistics

The percentage of the total mix for each transaction type must be disclosed. The percentage of New-Order transactions rolled back as a result of invalid item number must be disclosed. The average number of order-lines entered per New-Order transaction must be disclosed. The percentage of remote order lines per New-Order transaction must be disclosed. The percentage of remote Payment transactions must be disclosed. The percentage of customer selections by customer last name in the Payment and Order-Status transactions must be disclosed. The percentage of Delivery transactions skipped due to there being fewer than necessary orders in the New-Order table must be disclosed.

Table 5.4: Transaction Statistics

Statistic		Value
New Order	Home warehouse order lines	99.00%
	Remote warehouse order lines	1.00%
	Rolled back transactions	1.00%
	Average items per order	10.00
Payment	Home warehouse	85.00%
	Remote warehouse	15.00%
	Accessed by last name	60.01%
Order Status	Accessed by last name	60.04%
Delivery	Skipped transactions	0
Transaction Mix	New Order	44.915%
	Payment	43.020%
	Order status	4.020%
	Delivery	4.025%
	Stock level	4.020%

Checkpoint Count and Location

The number of checkpoints in the Measurement Interval, the time in seconds from the start of the Measurement Interval to the first checkpoint, and the Checkpoint Interval must be disclosed.

One checkpoint per node occurred during the warm-up period and 4 checkpoints occurred during the measurement period.

LOG_CHECKPOINT_TIMEOUT parameter (set to 29 minutes) was used to control checkpointing, which specifies the amount of time that has passed since the incremental checkpoint at the position where the last write to the redo log occurred. This parameter also signifies that no buffer will remain dirty (in the cache) for more than integer seconds.

Checkpoint Duration

The start time and duration in seconds of at least the four longest checkpoints during the measurement Interval must be disclosed.

Checkpointing was controlled using LOG_CHECKPOINT_TIMEOUT parameter (set to 29 minutes), specifies the amount of time that has passed since the incremental checkpoint at the position where the last write to the redo log occurred. This parameter also signifies that no buffer will remain dirty (in the cache) for more than integer seconds.

The checkpoints occurred during the measurement interval had the same duration demonstrating that the incremental checkpoints was keeping up with changes as shows in the table below.

	Ckpt S/E	Duration		Ckpt S/E	Duration		Ckpt S/E	Duration		Ckpt S/E	Duration
Node1	0:11:20		Node5	0:13:57		Node9	0:15:54		Node13	0:17:54	
	0:40:50	0:29:30		0:43:28	0:29:31		0:45:30	0:29:36		0:47:33	0:29:39

Clause 6 Related Items

RTE Descriptions

If the RTE is commercially available, then its inputs must be specified. Otherwise, a description must be supplied of what inputs (e.g., scripts) to the RTE had been used.

PRTE Software was used to simulate terminal users, generate random data and record response times. This package ran on systems that are distinct from the system under test. PRTE command file used is included in Appendix A.

Emulated Components

It must be demonstrated that the functionality and performance of the components being emulated in the Driver System are equivalent to the priced system. The results of the test described in Clause 6.6.3.4 must be disclosed.

Due to the large number of PCs and associated hardware that would be required to run these tests, Remote Terminal Emulator was used to emulate the connected PCs and LAN. As configured for this test, the driver software emulates the traffic that would be observed from the users' PCs connected by Ethernet to the front-end clients using HTTP (HyperText Transfer Protocol) over TCP/IP.

The driver setup consisted of 40 ProLiant servers. There were 16 ProLiant servers used as master drivers and one ProLiant server used as control driver.

Functional Diagrams

A complete functional diagram of both the benchmark configuration and the configuration of the proposed (target) system must be disclosed. A detailed list of all hardware and software functionality being performed on the Driver System and its interface to the SUT must be disclosed.

The diagram in Section 1 shows the tested and priced benchmark configurations.

Networks

The network configuration of both the tested services and proposed (target) services which are being represented and a thorough explanation of exactly which parts of the proposed configuration are being replaced with the Driver System must be disclosed.

The bandwidth of the networks used in the tested/priced configuration must be disclosed.

Section 1 of this report contains detailed diagram of both the benchmark configuration and the priced configuration.

The hp Integrity rx5670 Cluster 64P consisted of 16 servers. An hp ProCurve Switch 4148gl, Gigabit Ethernet Switch, was used as cluster interconnect. The 16 servers and 80 clients were connected using eight 16 port Gigabit Ethernet switches. The driver setup consisted of 40 ProLiant servers. There were 16 ProLiant servers used as master drivers and one ProLiant server used as control driver.

Operator Intervention

If the configuration requires operator intervention (see Clause 6.6.6), the mechanism and the frequency of this intervention must be disclosed.

This configuration does not require any operator intervention to sustain eight hours of the reported throughput.

Clause 7 Related Items

System Pricing

A detailed list of hardware and software used in the priced system must be reported. Each separately orderable item must have vendor part number, description, and release/revision level, and either general availability status or committed delivery date. If package-pricing is used, vendor part number of the package and a description uniquely identifying each of the components of the package must be disclosed. Pricing source and effective date(s) of price(s) must also be reported.

The total 3 year price of the entire configuration must be reported, including: hardware, software, and maintenance charges. Separate component pricing is recommended. The basis of all discounts used must be disclosed.

The details of the hardware and software are reported in the front of this report as part of the executive summary. All third party quotations are included at the end of this report as Appendix D.

Availability, Throughput, and Price Performance

The committed delivery date for general availability (availability date) of products used in the price calculation must be reported. When the priced system includes products with different availability dates, the reported availability date for the priced system must be the date at which all components are committed to be available.

A statement of the measured tpmC as well as the respective calculations for the 3-year pricing, price/performance (price/tpmC), and the availability date must be included.

Maximum Qualified Throughput - 1184893.38 tpmC
Price per tpmC - \$5.42 per tpmC
Available - April 30, 2004, Hardware Available Now.

Country Specific Pricing

Additional Clause 7 related items may be included in the Full Disclosure Report for each country specific priced configuration. Country specific pricing is subject to Clause 7.1.7

This system is being priced for the United States of America.

Usage Pricing

For any usage pricing, the sponsor must disclose:

- Usage level at which the component was priced.
- A statement of the company policy allowing such pricing.

The component pricing based on usage is shown below:

- Oracle Database 10g Enterprise Edition with Real Application Cluster and Partitioning
- Red Hat Enterprise Linux AS 3
- Red Hat Enterprise Linux ES
- BEA Tuxedo CTS 8.1

PERFORMANCE METRICS INC.
TPC Certified Auditors

December 4, 2003

Mr. Raghunath Othayoth & Bryon Georgson
Hewlett-Packard Company
Database Performance Lab
20555 SH 249
Houston, TX 77070

I have verified the TPC Benchmark™ C client/server for the following configuration:

Platform: HP Integrity rx5670 cluster 64P
Database Manager: Oracle Database 10g Enterprise Edition
Operating System: Red Hat Enterprise Linux AS 3
Transaction Manager: BEA Tuxedo 8.1

16 Servers: HP rx5670				
CPUs (each node)	Memory (each node)	Disks (shared)	90% Response	tpmC
4 Itanium 2 6M Processors @ 1.5 GHz	Main: 48 GB cache: 6 MB	672 18GB 1,344 36GB 224 146GB	4.91	1,184,893.37

80 Clients: ProLiant DL360			
Number of Clients	CPUs	Memory	Disks
16	2 Intel Xeon™ Processors @ 2.4 GHz	Main: 1 GB Cache: 512KB	1 @ 36GB
24	2 Intel Xeon™ Processors @ 2.8 GHz	Main: 1 GB Cache: 512KB	1 @ 36GB
40	2 Intel Xeon™ Processors @ 3.06 GHz	Main: 1 GB Cache: 512KB	1 @ 36GB

PERFORMANCE METRICS INC.
TPC Certified Auditors

In my opinion, these performance results were produced in compliance with the TPC requirements for the benchmark. The following attributes of the benchmark were given special attention:

- The transactions were correctly implemented.
- The database was properly sized and populated.
- The database was properly scaled with 128,016 warehouses.
- The ACID properties were met including loss of all nodes, 1 node and the interconnect mechanism.
- Input data was generated according to the specified percentages.
- Eight hours of mirrored log space was configured on the measured system.
- Eight hours of dynamic table growth space was configured on the measured system.
- The 60-day space calculation was verified; the measured system had sufficient storage.
- Measurement cycle times included a delay of 0.1 seconds.
- There were 1,280,160 user contexts present on the system.
- Each user started with a different random number seed.
- The NURand constants used for database load and at run time were 1 and 86.
- The steady state portion of the test was 2 hours.
- Sixteen checkpoints (1 per node) were taken before the measured interval.
- Incremental checkpointing was used to keep the cache up to date. The checkpoints taken during the measurement interval all had approximately the same duration demonstrating that incremental checkpointing was keeping up with changes.
- The system pricing was checked for major components and maintenance.

Auditor Notes:

None

Sincerely,

Lorna Livingtree
Auditor

-----
create_cache_views.sql
-----
rem This script creates four views that when queried will return
rem the total number of buffers in the buffer cache and the total
rem number of cloned buffers from each of the database's
rem tablespaces.
rem
rem This assumes that each table and index is in its own
rem tablespace.
rem If this is not the case, another query can be used which uses
rem the
rem database's object tables to decipher the different objects.
rem However,
rem this query is slower.
rem
rem This script assumes 7.3.x. If you are using V7.2.x or below,
rem please
rem replace svrmgr1 with sqldba lmode=y.
rem
rem Modification History:
rem
rem wbattist      16-Jun-1996      Create two additional views to
rem keep
rem                                     track of the number of clones in
rem each
rem                                     tablespace.
rem
rem wbattist      24-May-1995      Add the state check for the cbf
rem view
rem                                     to ensure that cloned blocks are
rem not
rem                                     counted.
rem
rem
rem

#Where:
#<domain> can be:
# - an user name
# - a group name, with @group syntax
# - the wildcard *, for default entry
#
#<type> can have the two values:
# - "soft" for enforcing the soft limits
# - "hard" for enforcing hard limits
#
#<item> can be one of the following:
# - core - limits the core file size (KB)
# - data - max data size (KB)
# - fsize - maximum filesize (KB)
# - memlock - max locked-in-memory address space (KB)
# - nofile - max number of open files
# - rss - max resident set size (KB)
# - stack - max stack size (KB)
# - cpu - max CPU time (MIN)
# - nproc - max number of processes
# - as - address space limit
# - maxlogins - max number of logins for this user
# - priority - the priority to run user process with
# - locks - max number of file locks the user can hold
#
#<domain>      <type>  <item>      <value>

#
# DefaultType is the default MIME type the server will use for a
# document

```

```

# if it cannot otherwise determine one, such as from filename
# extensions.
# If your server contains mostly text or HTML documents,
# "text/plain" is
# a good value. If most of your content is binary, such as
# applications
# or images, you may want to use "application/octet-stream" instead
# to
# keep browsers from trying to display binary files as though they
# are
# text.
#
DefaultType text/plain

#
# The mod_mime_magic module allows the server to use various hints
# from the
# contents of the file itself to determine its type. The
# MIMEMagicFile
# directive tells the module where the hint definitions are
# located.
#
<IfModule mod_mime_magic.c>

Per your request for information on pricing for several Red Hat products to be used in conjunction with your TPC-C benchmark testing, please find the quote below. These prices are valid for 30 days.

Part Number	Description	Unit Price	Quantity	Price
TBD	Red Hat Enterprise Linux AS for the Itanium Processor (version 3 Standard Edition)	\$1,992	1	\$1,992
TBD	2 Additional Years Subscription to Red Hat Enterprise Linux AS for the Itanium processor (version 3 Standard Edition)	\$1,992	2	\$3,984
TBD	Red Hat Enterprise Linux ES (version 3 Standard Edition)	\$799	11	\$8,789
TBD	2 Additional Years Subscription to Red Hat Enterprise Linux ES (version 3 Standard Edition)	\$799	16	\$12,784
TOTAL				\$27,549.00

Products will be orderable through www.redhat.com or Red Hat Sales 1-888-REDHAT-1. If we can be of any further assistance, please contact Mike Ferris at mferris@redhat.com.

*Support and maintenance for software includes minimum annual configuration and installation support and continuous proactive update and upgrade support via Red Hat Network.

Per your request I am enclosing the pricing information regarding TUXEDO 6.5 that you requested. This pricing applies to Tuxedo 6.4, 6.5, 7.1,8.0 and 8.1. Please note that Tuxedo 8.1 is our most recent version of Tuxedo. Core functionality services (CFS)-R pricing is appropriate for your activities. As per the table below HP/Compaq systems are classified as either a Tier 1, 2, 3, 4 or 5 systems depending on the performance and CPU capacity of the system. The HP/Compaq DL 360 machines are Tier 1 machines – price is \$1,200 per server (License), eligible for a 5% discount = \$1,140 per server + \$252 per server (7x24) for support – support is non discountable. This quote is valid for 60 days from the date of this letter.

Tuxedo Core Functionality Services (CFS-R) Program Product Pricing and Description

TUX-CFS-R provides a basic level of middleware support for distributed computing, and is best used by organizations with substantial resources and knowledge for advanced distributed computing implementations.

TUX-CFS-R prices are server only and are based on the overall performance characteristics of the server and uses the same five tier computer classification as TUXEDO 6.4, 6.5, 7.1,8.0, and 8.1. Prices range from \$1,200 for Tier 1 to \$100,000 for Tier 5. Under this pricing option EVERY system running TUX-CFS-R at the user site must have a TUXEDO license installed and pay the appropriate per server license fees.

Very Truly Yours,

A handwritten signature in cursive script that reads "Robert Gieringer".

Rob Gieringer,
Worldwide Pricing Manager

BEA Tux/CFS-R Unlimited User License Fees Per Server

Unlimited User License fees per server	Number of Users	Dollar Amount	Maintenance (5 x 9) per year	Maintenance (7 x 24) per year
Tier 1 -- PC Servers with 1 or 2 CPUs, entry level RISC Uni-processor workstations and servers	Unlimited	\$1,200.00	\$216	\$252
Tier 2 - PC Servers with 3 or 4 CPUs, Midrange RISC Uni-processor servers and workstations with up to 2 CPUs	Unlimited	\$4,800.00	\$864	\$1,008
Tier 3 - Midrange Multiprocessors, up to 8 CPUs per system capacity	Unlimited	\$12,000.00	\$2,160	\$2,520
Tier 4 - Large (more than 8, less than 32 CPUs)	Unlimited	\$40,000.00	\$7,200	\$8,400
Tier 5 - Massively Parallel Systems, > 32 processors	Unlimited	\$100,000.00	\$18,000	\$21,000

PRODUCT DETAIL

Your office network gets gigabit speed to burn with NETGEAR's GS516T 16/100/1000Mbps Gigabit Switch

Your office network gets gigabit speed to burn with NETGEAR's GS516T 16/100/1000Mbps Gigabit Switch! Its 16 ports send data at scorching speeds - up to 1000Mbps per port in full-duplex mode, and every port also features 10/100/1000 automatic speed and full-duplex sensing plus Auto Uplink™, making this unmanaged, rack-mountable switch ideal for combining 10, 100, and 1000Mbps devices. Users can take advantage of the GS516's ability to deliver large amounts of multimedia, image, and video information in no time at all. It's invaluable as a robust and reliable network backbone for your 50- to 250-employee company.

Accessible: Plenty of bandwidth for all users, with 16 switched 10/100/1000 ports for PCs, servers, or switches.

Smart: All 16 ports provide automatic speed and duplex sensing, plus Auto Uplink™ to adjust for straight-through or crossover cables and make the right link.

Efficient: Each port delivers network speeds of up to 1000Mbps per port.

Straightforward: Easy to set up and easy to use. All ports feature integrated LEDs, so network monitoring couldn't be easier.

Features: 16 10/100/1000 ports
Up to 1000Mbps full-duplex throughput over Cat 5 cables
Auto-detects speed and duplex
Auto Uplink™ to make the right connection
Cost-effective backbone upgrade
