Third Edition – September 2003

Hewlett-Packard Company (HP) believes that the information in this document is accurate as of the publication date. The information in this document is subject to change without notice. HP assumes no responsibility for any errors that may appear in this document. The pricing information in this document is believed to accurately reflect the current prices as of the publication date. However, HP provides no warranty of the pricing information in this document.

Benchmark results are highly dependent upon workload, specific application requirements, and system design and implementation. Relative system performance will vary as a result of these and other factors. Therefore, TPC Benchmark C should not be used as a substitute for a specific customer application benchmark when critical capacity planning and/or product evaluation decisions are contemplated.

All performance data contained in this report were obtained in a rigorously controlled environment. Results obtained in other operating environments may vary significantly. HP does not warrant or represent that a user can or will achieve similar performance expressed in transactions per minute (tpmC) or normalized price/performance (\$/tpmC). No warranty of system performance or price/performance is expressed or implied in this report.

# Preface

---

The TPC Benchmark C was developed by the Transaction Processing Performance Council (TPC). The TPC was founded to define transaction processing benchmarks and to disseminate objective, verifiable performance data to the industry. This full disclosure report is based on the TPC Benchmark C Standard Specifications Version 5.1, released December, 2002.

## TPC Benchmark C Overview

The TPC describes this benchmark in Clause 0.1 of the specifications as follows:

TPC Benchmark™ C (TPC-C) is an OLTP workload. It is a mixture of read-only and update intensive transactions that simulate the activities found in complex OLTP application environments. It does so by exercising a breadth of system components associated with such environments, which are characterized by:

- The simultaneous execution of multiple transaction types that span a breadth of complexity
- On-line and deferred transaction execution modes
- Multiple on-line terminal sessions
- Moderate system and application execution time
- Significant disk input/output
- Transaction integrity (ACID properties)
- Non-uniform distribution of data access through primary and secondary keys
- Databases consisting of many tables with a wide variety of sizes, attributes, and relationships
- Contention on data access and update

The performance metric reported by TPC-C is a "business throughput" measuring the number of orders processed per minute. Multiple transactions are used to simulate the business activity of processing an order, and each transaction is subject to a response time constraint. The performance metric for this benchmark is expressed in transactions-per-minute-C (tpmC). To be compliant with the TPC-C standard, all references to tpmC results must include the tpmC rate, the associated price-per-tpmC, and the availability date of the priced configuration.

Although these specifications express implementation in terms of a relational data model with conventional locking scheme, the database may be implemented using any commercially available database management system (DBMS), database server, file system, or other data repository that provides a functionally equivalent implementation. The terms "table", "row", and "column" are used in this document only as examples of logical data structures.

TPC-C uses terminology and metrics that are similar to other benchmarks, originated by the TPC or others. Such similarity in terminology does not in any way imply that TPC-C results are comparable to other benchmarks. The only benchmark results comparable to TPC-C are other TPC-C results conformant with the same revision.

Despite the fact that this benchmark offers a rich environment that emulates many OLTP applications, this benchmark does not reflect the entire range of OLTP requirements. In addition, the extent to which a customer can achieve the results reported by a vendor is highly dependent on how closely TPC-C approximates the customer application. The relative performance of systems derived from this benchmark does not necessarily hold for other workloads or environments. Extrapolations to any other environment are not recommended.

Benchmark results are highly dependent upon workload, specific application requirements, and systems design and implementation. Relative system performance will vary as a result of these and other factors. Therefore, TPC-C should not be used as a substitute for a specific customer application benchmarking when critical capacity planning and/or product evaluation decisions are contemplated.

# **Abstract**

---

## **Overview**

This report documents the methodology and results of the TPC Benchmark C test conducted on the HP ProLiant ML350-G3. The operating system used for the benchmark was Windows Server 2003. The DBMS used was Microsoft SQL Server 2000 Standard Edition.

## **TPC Benchmark C Metrics**

The standard TPC Benchmark C metrics, tpmC (transactions per minute), price per tpmC (three year capital cost per measured tpmC), and the availability date are reported as:

19526.27tpmC

\$2.25 per tpmC

The availability date is May 12, 2003.

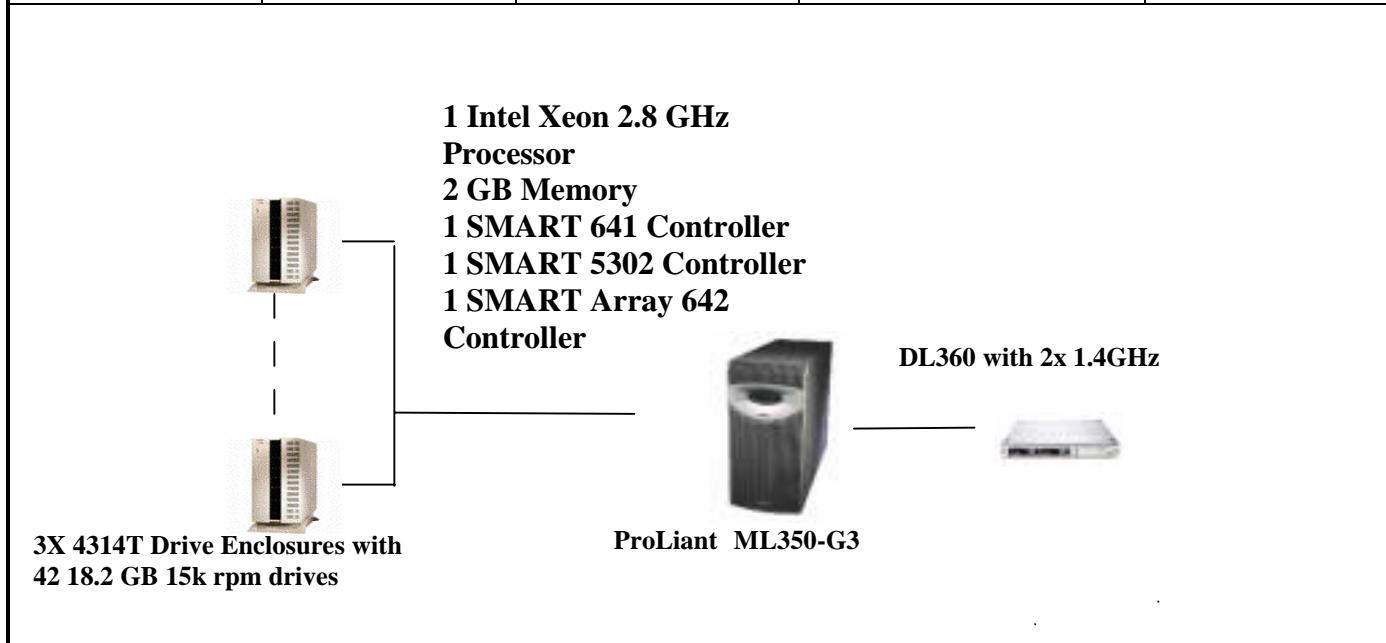

## **Standard and Executive Summary Statements**

The following pages contain executive summary of results for this benchmark.

## **Auditor**

The benchmark configuration, environment and methodology were audited by Lorna Livingtree of Performance Metrics, Inc. to verify compliance with the relevant TPC specifications.

Checkpoint interval			30 minutes

# **General Items**

---

## **Test Sponsor**

*A statement identifying the benchmark sponsor(s) and other participating companies must be provided.*

This benchmark was sponsored by Hewlett-Packard Company. The benchmark was developed and engineered by Hewlett-Packard Company. Testing took place at HP benchmarking laboratories in Houston, Texas.

## **Application Code and Definition Statements**

*The application program (as defined in clause 2.1.7) must be disclosed. This includes, but is not limited to, the code implementing the five transactions and the terminal input output functions.*

Appendix A contains all source code implemented in this benchmark.

## **Parameter Settings**

*Settings must be provided for all customer-tunable parameters and options which have been changed from the defaults found in actual products, including by not limited to:*

- *Database options*
- *Recover/commit options*
- *Consistency locking options*
- *Operating system and application configuration parameters*

*This requirement can be satisfied by providing a full list of all parameters.*

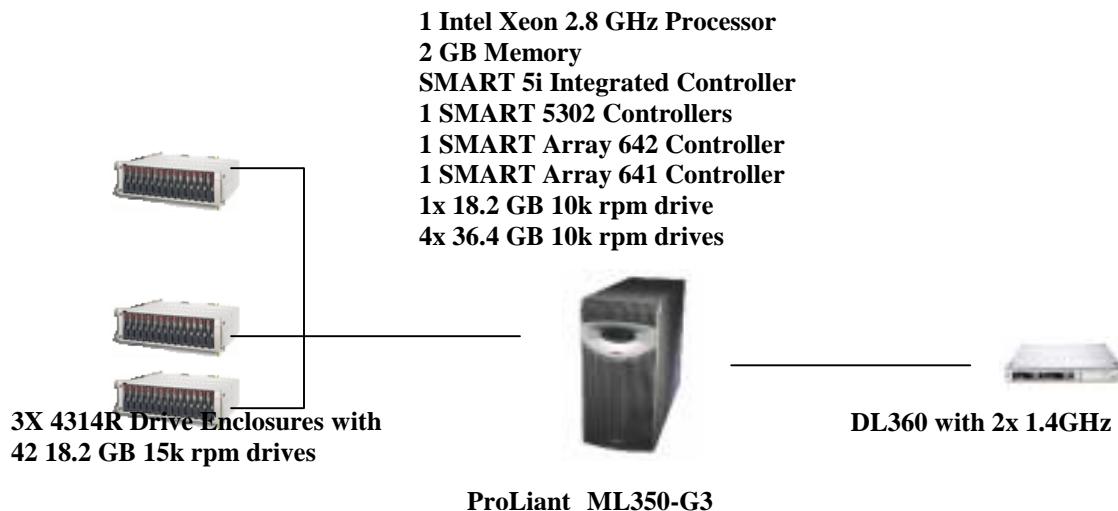

Appendix C contains the tunable parameters to for the database, the operating system, and the transaction monitor.

## **Configuration Items**

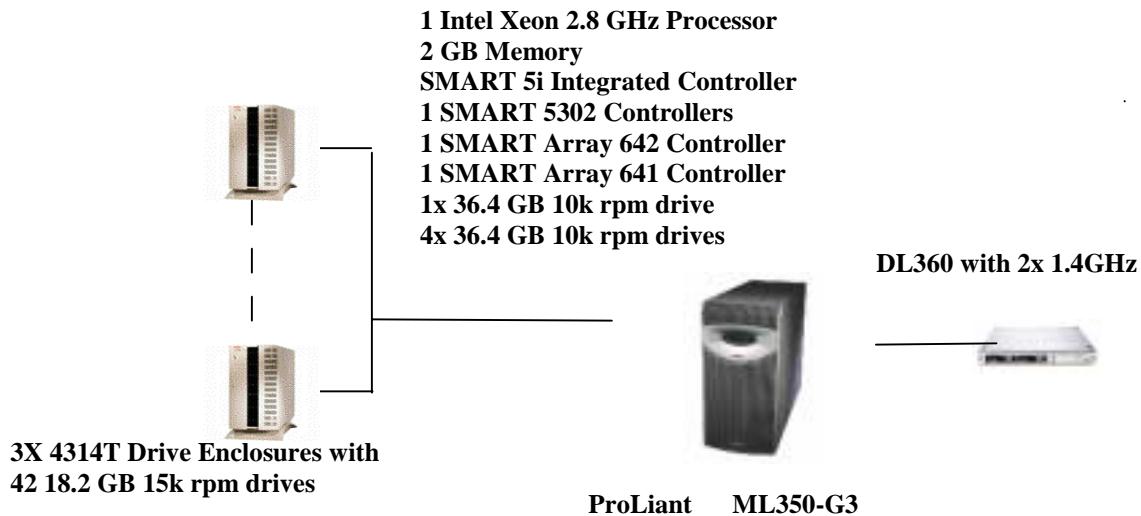

*Diagrams of both measured and priced configurations must be provided, accompanied by a description of the differences.*

The configuration diagram for both the tested and priced systems are the same and included on the following page.

**Figure 1a. Benchmarked Configuration**

**Figure 1b. Priced Configuration**

# ***Clause 1 Related Items***

---

## **Table Definitions**

*Listing must be provided for all table definition statements and all other statements used to set up the database.*

Appendix B contains the code used to define and load the database tables.

## **Physical Organization of Database**

*The physical organization of tables and indices within the database must be disclosed.*

The tested configuration consisted of: 42 drives at 18.2GB for data, 4 drives at 36.4GB for log and one 18.2GB drive for the operating system.

### **Benchmarked Configuration:**

#### **SMART 5i Integrated Controller,**

LOGICAL DRIVE C:                           Total Capacity = 16.95 GB  
Microsoft Windows Server 2003

#### **SMART-642 Controller, Slot 1, Logical Volume 1**

LOGICAL DRIVE E:                           Total Capacity = 67.83 GB                   RAID 0+1  
MSSQL\_tpcc\_log

#### **SMART-5302 Controller, Slot 2, Logical Volume 1**

LOGICAL DRIVE F:                           Total Capacity = 31.25GB                   RAID 0  
MSSQL\_cs1

#### **SMART-5302 Controller, Slot 2, Logical Volume 2**

LOGICAL DRIVE I:                           Total Capacity = 15.13 GB                   RAID 0  
MSSQL\_misc1

#### **SMART-5302 Controller, Slot 2, Logical Volume 3**

LOGICAL DRIVE X:                           Total Capacity = 80 GB                   RAID 0+1  
Tpccbck1

#### **SMART-5302 Controller, Slot 2, Logical Volume 4**

LOGICAL DRIVE G:                           Total Capacity = 31.25GB                   RAID 0  
MSSQL\_cs2

#### **SMART-5302 Controller, Slot 2, Logical Volume 5**

LOGICAL DRIVE J:                           Total Capacity = 15.13 GB                   RAID 0  
MSSQL\_misc21

#### **SMART-5302 Controller, Slot 2, Logical Volume 6**

LOGICAL DRIVE Y:                           Total Capacity = 80 GB                   RAID 0+1  
Tpccbck2

**SMART-642 Controller, Slot 3, Logical Volume 1**

LOGICAL DRIVE H:                   Total Capacity = 31.25GB                   RAID 0  
MSSQL\_cs3

**SMART-642 Controller, Slot 3, Logical Volume 2**

LOGICAL DRIVE K:                   Total Capacity = 15.13 GB                   RAID 0  
MSSQL\_misc3

**SMART-642 Controller, Slot 3, Logical Volume 3**

LOGICAL DRIVE Z:                   Total Capacity = 80 GB    RAID 0+1  
Tpccback3

**Priced Configuration vs. Measured Configuration:**

The measured and priced configuration differ in that the measured configuration used disk drives for the Backup device. The priced configuration used 4314T drive enclosures instead of 4314R drive enclosures, and used a DAT drive for backup.

**Insert and Delete Operations**

*It must be ascertained that insert and/or delete operations to any of the tables can occur concurrently with the TPC-C transaction mix. Furthermore, any restrictions in the SUT database implementation that precludes inserts beyond the limits defined in Clause 1.4.11 must be disclosed. This includes the maximum number of rows that can be inserted and the minimum key value for these new rows.*

All insert and delete functions were fully operational during the entire benchmark.

**Partitioning**

*While there are a few restrictions placed upon horizontal or vertical partitioning of tables and rows in the TPC-C benchmark, any such partitioning must be disclosed.*

No partitioning was used in this benchmark.

**Replication, Duplication or Additions**

*Replication of tables, if used, must be disclosed. Additional and/or duplicated attributes in any table must be disclosed along with a statement on the impact on performance.*

No replications, duplications or additional attributes were used in this benchmark.

## ***Clause 2 Related Items***

---

### **Random Number Generation**

*The method of verification for the random number generation must be described.*

In the Benchcraft RTE from Microsoft, each driver engine uses an independent random number sequence. All of the users within a given driver draw from the same sequence.

The Benchcraft RTE computes random integers as described in "Random Numbers Generators: Good Ones Are Hard to Find." Communications of the ACM - October 1988 Volume 31 Number 10.

The seeds for each user were captured and verified by the auditor to be unique. In addition, the contents of the database were systematically searched, and randomly sampled by the auditor for patterns that would indicate the random number generator had affected any kind of a discernible pattern; none were found.

### **Input/Output Screen Layout**

*The actual layout of the terminal input/output screens must be disclosed.*

All screen layouts followed the specifications exactly.

### **Priced Terminal Feature Verification**

*The method used to verify that the emulated terminals provide all the features described in Clause 2.2.2.4 must be explained. Although not specifically priced, the type and model of the terminals used for the demonstration in 8.1.3.3 must be disclosed and commercially available (including supporting software and maintenance).*

The terminal attributes were verified by the auditor. The auditor manually exercised each specification on a representative HP ProLiant web server.

### **Presentation Manager or Intelligent Terminal**

*Any usage of presentation managers or intelligent terminals must be explained.*

Application code running on the client machines implemented the TPC-C user interface. No presentation manager software or intelligent terminal features were used. The source code for the forms applications is listed in Appendix A.

## Transaction Statistics

Table 2.1 lists the numerical quantities that Clauses 8.1.3.5 to 8.1.3.11 require.

**Table 2.1 Transaction Statistics**

Statistic		Value
New Order	Home warehouse order lines	99.00%
	Remote warehouse order lines	1.00%
	Rolled back transactions	1.00%
	Average items per order	10.00
Payment	Home warehouse payments	85.00%
	Remote warehouse payments	15.00%
	Accessed by last name	60.04%
Order Status	Accessed by last name	60.01%
Transaction Mix	New Order	44.94%
	Payment	43.03%
	Order status	4.02%
	Delivery	4.02%
	Stock level	4.00%

## Queuing Mechanism

The queuing mechanism used to defer the execution of the Delivery transaction must be disclosed.

Microsoft COM+ on each client machine served as the queuing mechanism to the database. Each delivery request was submitted to Microsoft COM+ asynchronously with control being returned to the client process immediately and the deferred delivery part completing asynchronously.

The source code is listed in Appendix A.

# ***Clause 3 Related Items***

---

## **Transaction System Properties (ACID)**

*The results of the ACID tests must be disclosed along with a description of how the ACID requirements were met. This includes disclosing which case was followed for the execution of Isolation Test 7.*

All ACID property tests were successful. The executions are described below.

### **Atomicity**

*The system under test must guarantee that the database transactions are atomic; the system will either perform all individual operations on the data or will assure that no partially completed operations leave any effects on the data.*

#### **Completed Transactions**

A row was selected in a script from the warehouse, district and customer tables, and the balances noted. A payment transaction was started with the same warehouse, district and customer identifiers and a known amount. The payment transaction was committed and the rows were verified to contain correctly updated balances.

#### **Aborted Transactions**

A row was selected in a script from the warehouse, district and customer tables, and the balances noted. A payment transaction was started with the same warehouse, district and customer identifiers and a known amount. The payment transaction was rolled back and the rows were verified to contain the original balances.

### **Consistency**

*Consistency is the property of the application that requires any execution of a database transaction to take the database from one consistent state to another, assuming that the database is initially in a consistent state.*

Consistency conditions one through four were tested using a script to issue queries to the database. The results of the queries verified that the database was consistent for all four tests.

A run was executed under full load lasting over two hours and included a checkpoint.

The script was executed again. The result of the same queries verified that the database remained consistent after the run.

### **Isolation**

*Sufficient conditions must be enabled at either the system or application level to ensure the required isolation defined above (clause 3.4.1) is obtained.*

Isolation tests one through nine were executed using shell scripts to issue queries to the database. Each script included timestamps to demonstrate the concurrency of operations. The results of the queries were captured to files. The captured files were verified by the auditor to demonstrate the required isolation had been met.

In addition, the phantom tests and the stock level tests were executed and verified.

For Isolation test seven, case A was followed.

## Durability

*The tested system must guarantee durability: the ability to preserve the effects of committed transaction and insure database consistency after recovery from any one of the failures listed in Clause 3.5.3.*

### Durable Media Failure

#### Loss of Data and Log

To demonstrate recovery from a permanent failure of durable medium containing DBMS logs and TPC-C tables, the following steps were executed:

- The full database was started, but only 200 of the warehouses were accessed for this test.
- The total number of New Orders was determined by the sum of D\_NEXT\_O\_ID of all rows in the DISTRICT table giving the beginning count.
- The RTE was started with 2000 users.
- The test was allowed to run for a minimum of 10 minutes.
- One log disk was removed from the server.
- Since the disk was mirrored, processing was not interrupted. This was verified by checking the users status on the RTE.
- One of the data disks was removed from a drive cabinet.
- When Microsoft SQL Server recorded errors about not being able to access the database, the RTE was shut down.
- A dump of the transaction log was taken and the Microsoft SQL Server was shutdown.
- A new log disk was inserted into the server. A new data disk was inserted into the data drive cabinet. After the RAID recovery process finished, the system was rebooted and Microsoft SQL Server was started.
- The database was restored from backup and the transaction log dump was applied.
- Consistency condition #3 was executed and verified.
- Step 2 was repeated and the difference between the first and second counts was noted.
- An RTE report was generated for the entire run time giving the number of NEW-ORDERS successfully returned to the RTE.
- The counts in step 13 and 14 were compared and the results verified that all committed transactions had been successfully recovered.
- Samples were taken from the RTE files and used to query the database to demonstrate successful transactions had corresponding rows in the ORDER table.

#### **Instantaneous Interruption and Loss of Memory**

Because loss of power erases the contents of memory, the instantaneous interruption and the loss of memory tests were combined into a single test. This test was executed on a fully scaled database of 1580 warehouses under a full load of 15800 users. The following steps were executed:

- The total number of New Orders was determined by the sum of D\_NEXT\_O\_ID of all rows in the DISTRICT table giving the beginning count.
- The RTE was started with 15800 users.
- The test was allowed to run for a minimum of 10 minutes.
- System crash and loss of memory was induced by removing the power cord. No battery backup or Uninterruptible Power Supply (UPS) were used to preserve the contents of memory.
- The RTE was shutdown.
- Power was restored and the system restarted.
- Microsoft SQL Server was restarted and performed an automatic recovery.
- Consistency condition #3 was executed and verified.
- Step 1 was repeated and the difference between the first and second counts was noted.
- An RTE report was generated for the entire run time giving the number of NEW-ORDERS successfully returned to the RTE.

- The counts in step 10 and 11 were compared and the results verified that all committed transactions had been successfully recovered.
- Samples were taken from the RTE files and used to query the database to demonstrate successful transactions had corresponding rows in the ORDER table.

# **Clause 4 Related Items**

---

## **Initial Cardinality of Tables**

*The cardinality (e.g. number of rows) of each table, as it existed at the start of the benchmark run, must be disclosed. If the database was over-scaled and inactive rows of the WAREHOUSE table were deleted, the cardinality of the WAREHOUSE table as initially configured and the number of rows deleted must be disclosed.*

**Table 4.1 Number of Rows for Server**

Table	Cardinality as built
Warehouse	1,580
District	15,800
Customer	48,300,000
History	48,300,000
Orders	48,300,000
New Order	14,490,000
Order Line	482,994,468
Stock	161,000,000
Item	100,000
Deleted Warehouses	0

## **Database Layout**

*The distribution of tables and logs across all media must be explicitly depicted for tested and priced systems.*

The benchmarked configuration used 1 SMART-5302 Array controllers with 2 SCSI channels, SMART-642 Array controller with 1 internal and 1 SMART-642 Array controller with 1 internal and 1 external SCSI channel. Each controller is capable of accessing up to 14 disk drives per channel, and supports RAID 0, RAID 0+1, and RAID 5 per each logical volume configured. The data tables were stored on 3 RAID arrays of (14) 18.2GB 15K drives each. Each array was configured as RAID 0 and housed logical drives for database data. The SMART-5302 Array controllers also housed a RAID 0+1 volume used for backup of the database. The SMART-642 Array controller was connected to one external array consisting of (14) 18.2GB 15K drives. The SMART-641 Array controller was connected to one internal array consisting of (4) 36.4GB 10K drives, and housed a RAID 0+1 logical volume for the database log. The operating system was housed internally on the integrated Smart-5i controller as one 18.2 GB 15K drive. The controller for the transaction log had the cache disabled. All RAID volumes used hardware RAID.

Section 1.2 of this report details the distribution of database tables across all disks. The code that creates the filegroups and tables is included in Appendix B.

## Type of Database

A statement must be provided that describes:

- The data model implemented by DBMS used (e.g. relational, network, hierarchical).
- The database interface (e.g. embedded, call level) and access language (e.g. SQL, DL/I, COBOL read/write used to implement the TPC-C transaction. If more than one interface/access language is used to implement TPC-C, each interface/access language must be described and a list of which interface/access language is used with which transaction type must be disclosed.

Microsoft SQL Server 2000 is a relational DBMS.

The interface used was Microsoft SQL Server stored procedures accessed with Remote Procedure Calls embedded in C code.

## Database Mapping

*The mapping of database partitions/replications must be explicitly described.*

The database was not replicated.

## 60 Day Space

*Details of the 60-day space computations along with proof that the database is configured to sustain 8 hours of growth for the dynamic tables (Order, Order-Line, and History) must be disclosed.*

To calculate the space required to sustain the database log for 8 hours of growth at steady state, the following steps were followed:

- The free space on the log file was queried using `dbcc sqlperf(logspace)`.
- Transactions were run against the database with a full load of users.
- The free space was again queried using `dbcc sqlperf(logspace)`.
- The space used was calculated as the difference between the first and second query.
- The number of NEW-ORDERS was verified from the difference in the sum(d\_next\_o\_id) taken from before and after the run.
- The space used was divided by the number of NEW-ORDERS giving a space used per NEW-ORDER transaction.
- The space used per transaction was multiplied by the measured tpmC rate times 480 minutes.

The same methodology was used to compute growth requirements for dynamic tables Order, Order-Line and History.

The details of both the 8-hour transaction log space requirement and the 60-day space requirement is shown in Appendix D.

# ***Clause 5 Related Items***

---

## **Throughput**

*Measured tpmC must be reported*

Measured tpmC	19526.27tpmC
Price per tpmC	\$2.25 per tpmC

## **Response Times**

*Ninetieth percentile, maximum and average response times must be reported for all transaction types as well as for the menu response time.*

**Table 5.2: Response Times**

Type	Average	90 <sup>th</sup> %	Maximum
New-Order	0.69	1.04	5.61
Payment	0.42	0.72	5.20
Order-Status	0.53	0.86	5.69
Interactive Delivery	0.10	0.11	0.18
Deferred Delivery	1.06	1.50	2.61
Stock-Level	3.92	4.98	8.78
Menu	0.10	0.11	0.32

## **Keying and Think Times**

*The minimum, the average, and the maximum keying and think times must be reported for each transaction type.*

**Table 5.3: Keying Times**

Type	Minimum	Average	Maximum
New-Order	18.00	18.02	18.03
Payment	3.00	3.02	3.03
Order-Status	2.00	2.02	2.02
Interactive Delivery	2.00	2.02	2.03
Stock-Level	2.00	2.02	2.03

**Table 5.4: Think Times**

Type	Minimum	Average	Maximum
New-Order	0.00	12.05	120.50
Payment	0.00	12.04	120.50
Order-Status	0.00	10.04	100.50
Interactive Delivery	0.00	5.05	50.50
Stock-Level	0.00	5.04	50.50

## **Response Time Frequency Distribution Curves and Other Graphs**

*Response Time frequency distribution curves (see Clause 5.6.1) must be reported for each transaction type.*

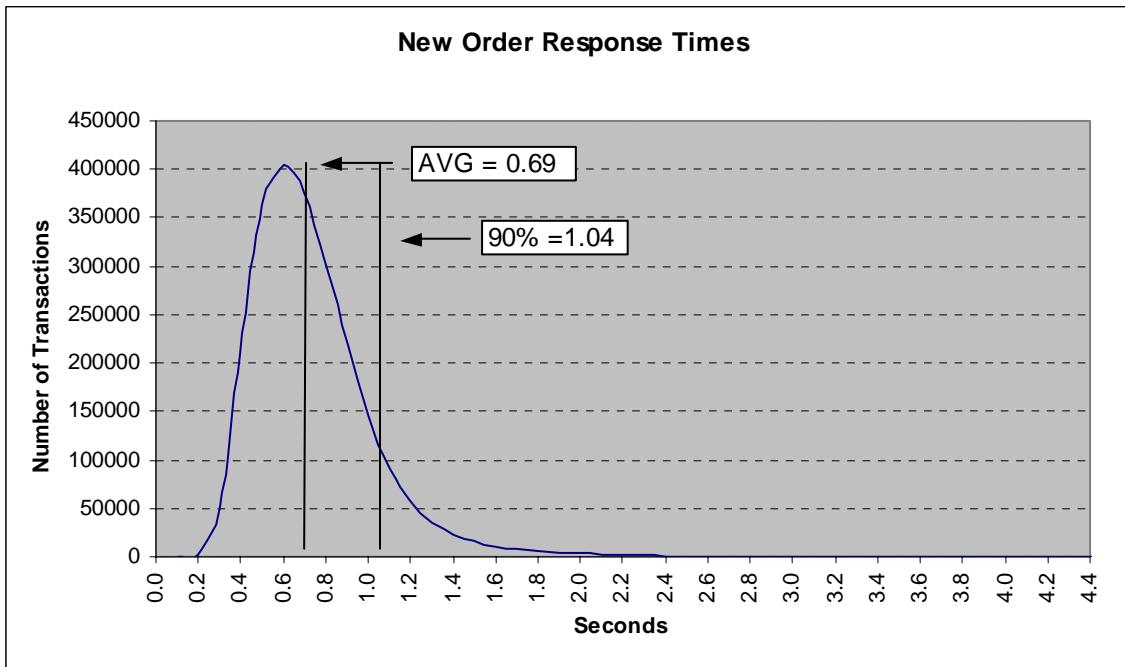

*The performance curve for response times versus throughput (see Clause 5.6.2) must be reported for the New-Order transaction.*

*Think Time frequency distribution curves (see Clause 5.6.3) must be reported for each transaction type.*

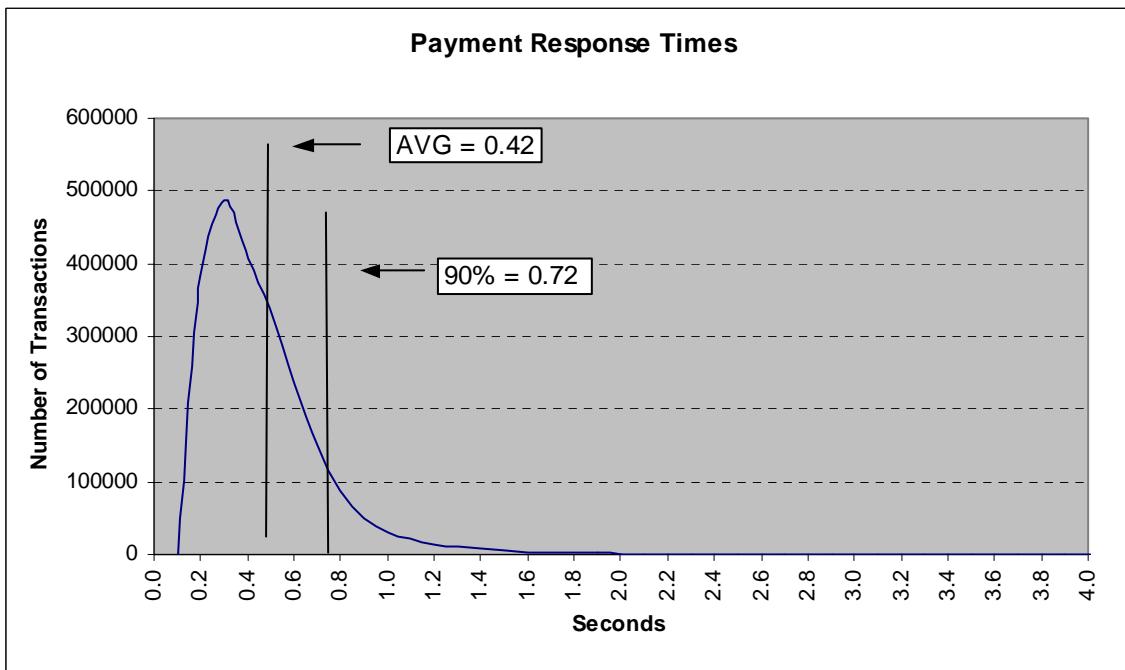

*Keying Time frequency distribution curves (see Clause 5.6.4) must be reported for each transaction type.*

*A graph of throughput versus elapsed time (see Clause 5.6.5) must be reported for the New-Order transaction.*

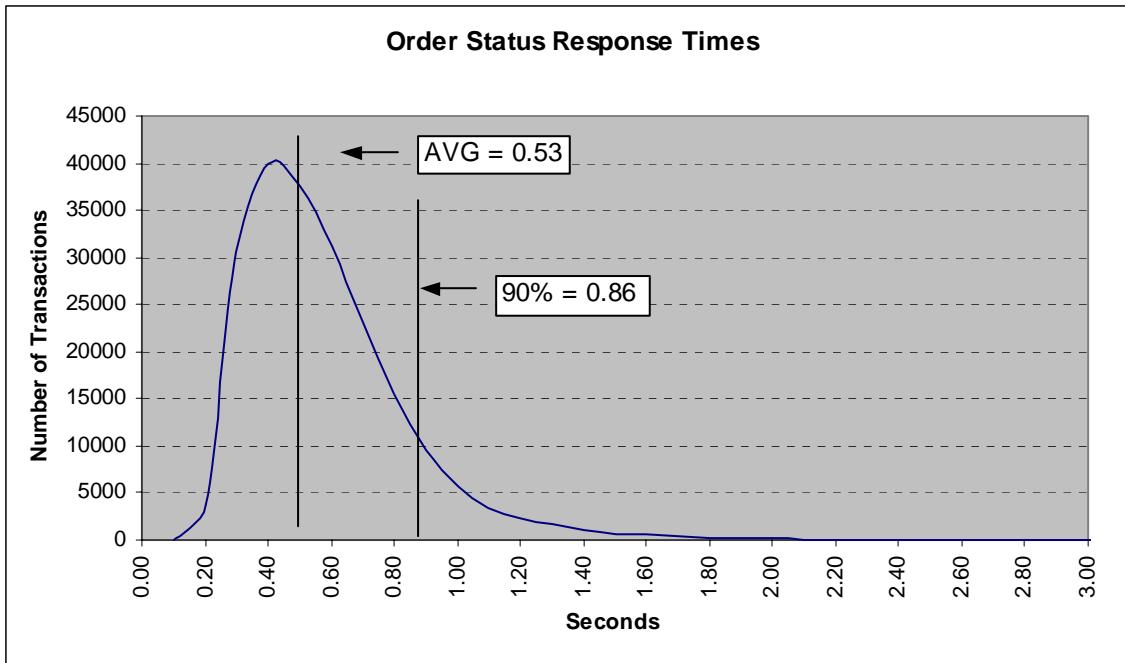

**Figure 2. New Order Response Time Distribution**

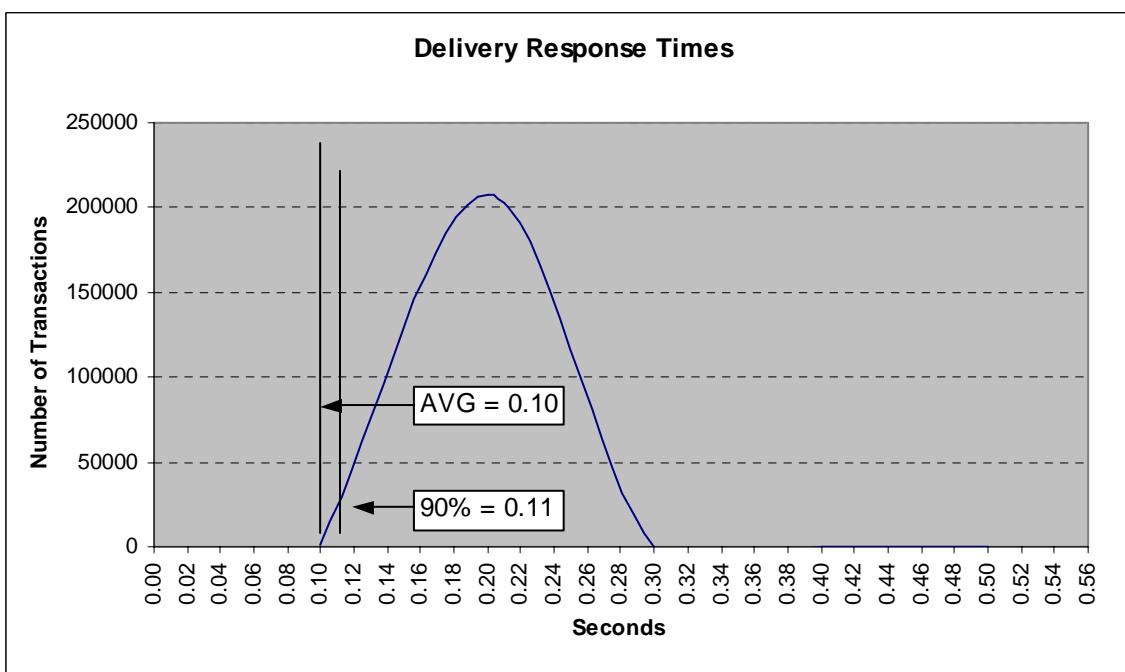

**Figure 3. Payment Response Time Distribution**

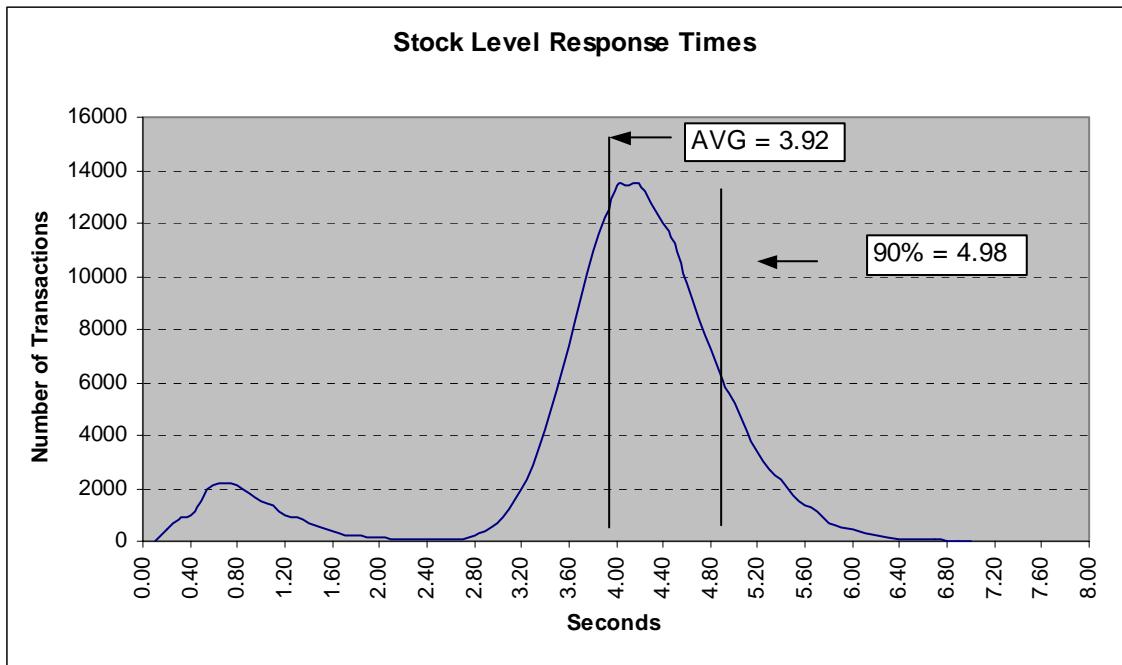

**Figure 4. Order Status Response Time Distribution**

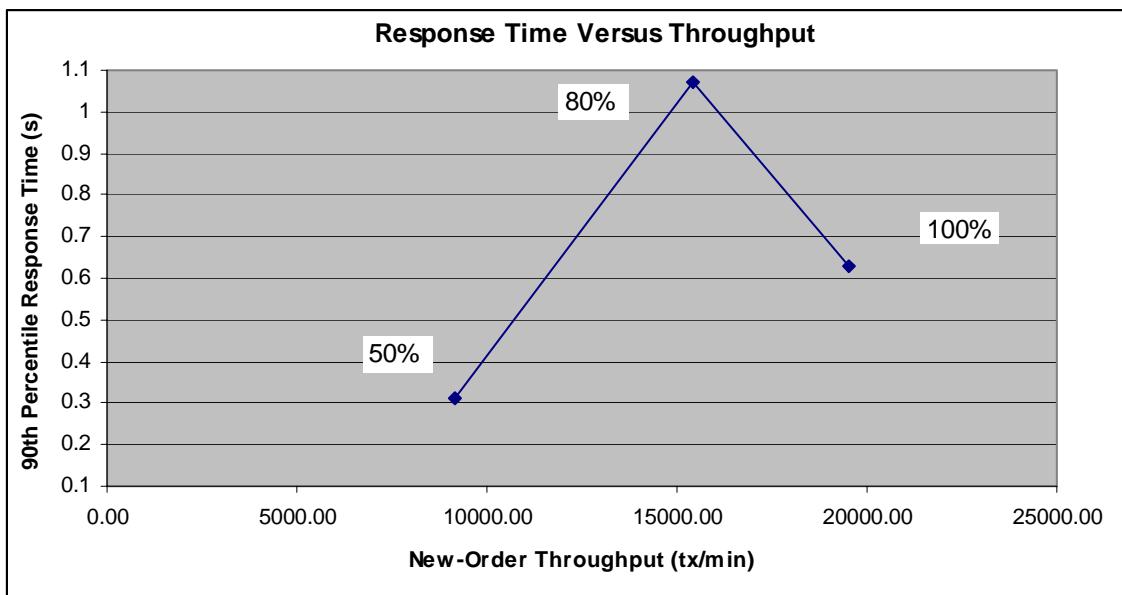

**Figure 5. Delivery Response Time Distribution**

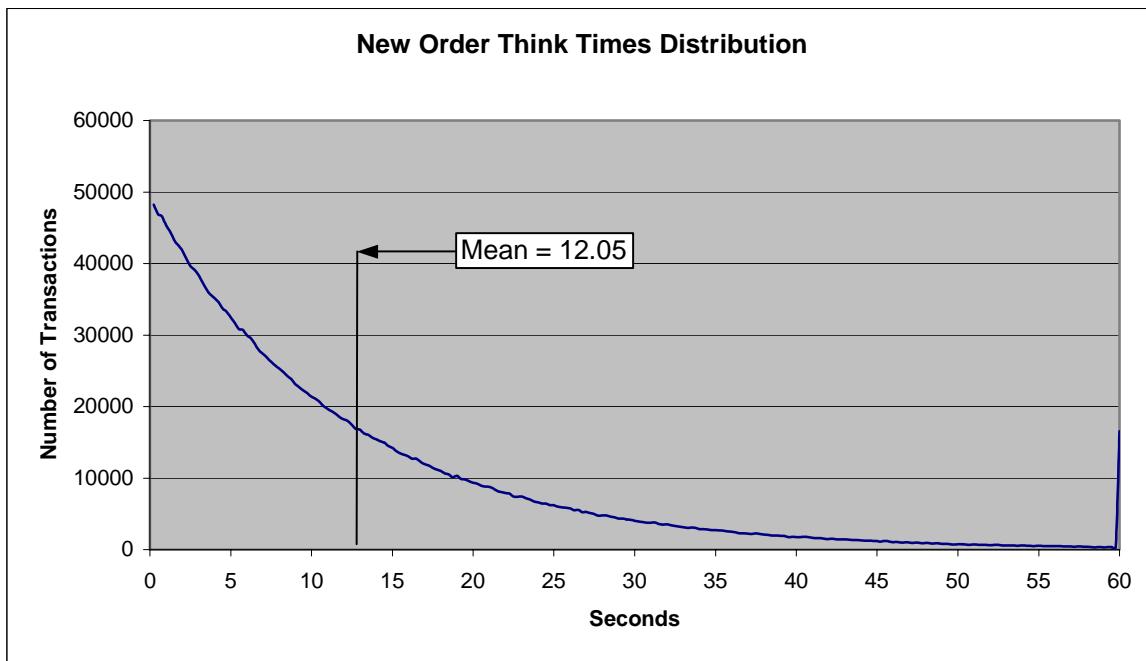

**Figure 6. Stock Level Response Time Distribution**

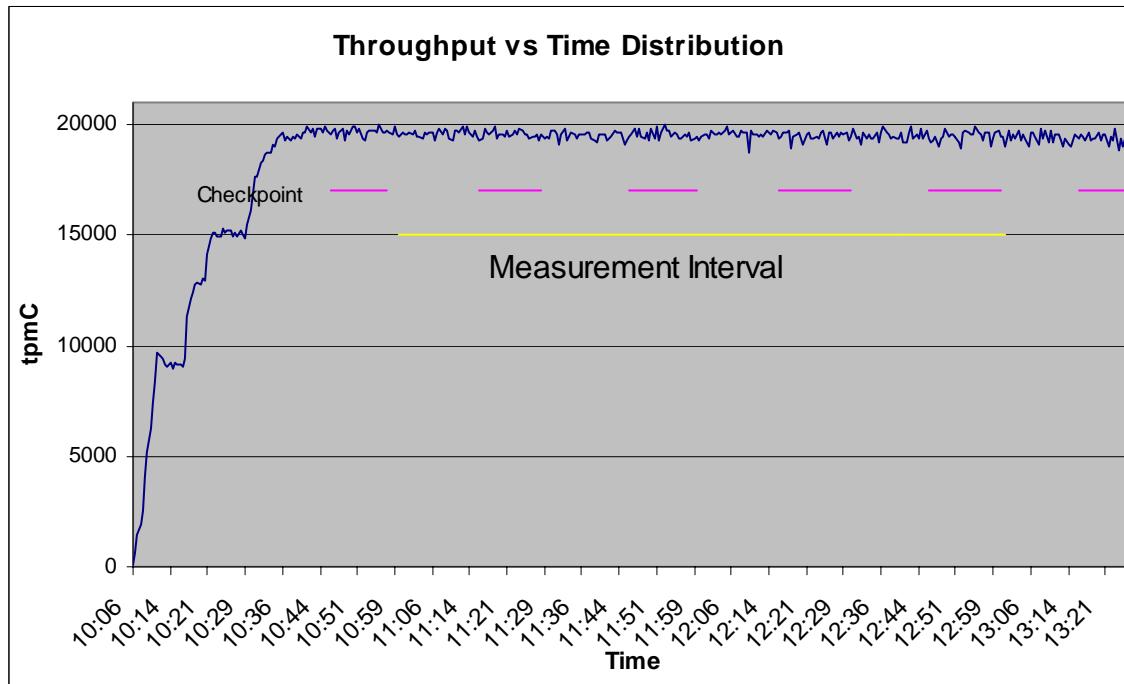

**Figure 7. Response Time vs. Throughput**

**Figure 8. New Order Think Time Distribution**

**Figure 9. Throughput vs. Time Distribution**

## **Steady State Determination**

*The method used to determine that the SUT had reached a steady state prior to commencing the measurement interval must be disclosed.*

Steady state was determined using real time monitor utilities from the RTE. Steady state was further confirmed by the throughput data collected during the run and graphed in Figure 10.

## **Work Performed During Steady State**

*A description of how the work normally performed during a sustained test (for example checkpointing, writing redo/undo log records, etc.), actually occurred during the measurement interval must be reported.*

The RTE generated the required input data to choose a transaction from the menu. This data was timestamped. The input screen for the requested transaction was returned and timestamped. The difference between these two timestamps was the menu response time. The RTE writes to the log file once per transaction on selective fields such as order id. There is one log file per driver engine.

The RTE generated the required input data for the chosen transaction. It waited to complete the minimum required key time before transmitting the input screen. The transmission was timestamped. The return of the screen with the required response data was timestamped. The difference between these two timestamps was the response time for that transaction.

The RTE then waited the required think time interval before repeating the process starting at selecting a transaction from the menu.

The RTE transmissions were sent to application processes running on the client machines through Ethernet LANs. These client application processes handled all screen I/O as well as all requests to the database on the server. The applications communicated with the database server over Ethernet LANs using ODBC and RPC calls.

To perform checkpoints at specific intervals, the SQL Server *recovery interval* was set to 60 and a script was written to schedule multiple checkpoints at specific intervals. The script included a wait time between each checkpoint equal to 30 minutes so that the checkpoint interval was an integral multiple of the measurement interval, which was 120 minutes. The checkpoint script was started manually after the RTE had all users logged in and the database had achieved steady state.

At each checkpoint, Microsoft SQL Server wrote to disk all memory pages that had been updated but not yet physically written to disk. The positioning of the measurement interval is depicted on the graph in Figure 10.

## **Measurement Period Duration**

*A statement of the duration of the measurement interval for the reported Maximum Qualified Throughput (tpmC) must be included.*

The reported measured interval was exactly 120 minutes long.

## **Regulation of Transaction Mix**

*The method of regulation of the transaction mix (e.g., card decks or weighted random distribution) must be described. If weighted distribution is used and the RTE adjusts the weights associated with each transaction type, the maximum adjustments to the weight from the initial value must be disclosed.*

The RTE was given a weighted random distribution, which was not adjusted during the run.

## **Transaction Statistics**

*The percentage of the total mix for each transaction type must be disclosed. The percentage of New-Order transactions rolled back as a result of invalid item number must be disclosed. The average number of order-lines entered per New-Order transaction must be disclosed. The percentage of remote order lines per New-Order transaction must be disclosed. The percentage of remote Payment transactions must be disclosed. The percentage of customer selections by customer last name in the Payment and Order-Status transactions must be disclosed. The percentage of Delivery transactions skipped due to there being fewer than necessary orders in the New-Order table must be disclosed.*

**Table 5.5: Transaction Statistics**

Statistic		Value
New Order	Home warehouse order lines	99.00%
	Remote warehouse order lines	1.00%
	Rolled back transactions	1.00%
	Average items per order	10.00
Payment	Home warehouse payments	85.00%
	Remote warehouse payments	15.00%
	Accessed by last name	59.97%
Delivery	Skipped transactions (interactive)	0
	Skipped transactions (deferred)	0
Order Status	Accessed by last name	60.04%
Transaction Mix	New Order	44.94%
	Payment	43.03%
	Order status	4.00%
	Delivery	4.02%
	Stock level	4.02%

## **Checkpoint Count and Location**

*The number of checkpoints in the Measurement Interval, the time in seconds from the start of the Measurement Interval to the first checkpoint, and the Checkpoint Interval must be disclosed.*

The initial checkpoint was started 17 minutes after the start of the ramp-up. Subsequent checkpoints occurred every 30 minutes. Each checkpoint in the measurement interval lasted approximately 10 minutes. The measurement interval contains four checkpoints.

## **Checkpoint Duration**

*The start time and duration in seconds of at least the four longest checkpoints during the Measurement Interval must be disclosed.*

Checkpoint Start Time	Duration
10:46:27a.m.	10 minutes, 56 seconds
11:16:25a.m.	12 minutes, 26 seconds
11:46:23p.m.	13 minutes, 30 seconds
12:16:20p.m.	14 minutes, 31 seconds
12:46:19p.m.	14 minutes, 32 seconds

# **Clause 6 Related Items**

---

## **RTE Descriptions**

*If the RTE is commercially available, then its inputs must be specified. Otherwise, a description must be supplied of what inputs (e.g., scripts) to the RTE had been used.*

The RTE used was Microsoft Benchcraft RTE. Benchcraft is a proprietary tool provided by Microsoft and is not commercially available. The RTE's input is listed in Appendix A.

## **Emulated Components**

*It must be demonstrated that the functionality and performance of the components being emulated in the Driver System are equivalent to the priced system. The results of the test described in Clause 6.6.3.4 must be disclosed.*

The driver system consisted of 1 HP ProLiant server. This driver machine emulated the users web browsers.

## **Functional Diagrams**

*A complete functional diagram of both the benchmark configuration and the configuration of the proposed (target) system must be disclosed. A detailed list of all hardware and software functionality being performed on the Driver System and its interface to the SUT must be disclosed.*

The driver system performed the data generation and input functions of the priced display device. It also captured the input and output data and timestamps for post-processing of the reported metrics. No other functionality was included on the driver system.

Section 1.4 of this report contains detailed diagrams of both the benchmark configuration and the priced configuration.

## **Networks**

*The network configuration of both the tested services and proposed (target) services that are being represented and a thorough explanation of exactly which parts of the proposed configuration are being replaced with the Driver System must be disclosed.*

*The bandwidth of the networks used in the tested/priced configuration must be disclosed.*

In the tested configuration, 1 driver (RTE) machine was connected through a 10/100/1000 switch to the client machine at 1000Mbs, thus providing the path from the RTE to the client. The server (SUT) was connected to the client through a CAT5e Ethernet cable on a separate 1000Mbs LAN.

The priced configuration was connected in the same manner as the tested configuration.

## **Operator Intervention**

*If the configuration requires operator intervention (see Clause 6.6.6), the mechanism and the frequency of this intervention must be disclosed.*

This configuration does not require any operator intervention to sustain eight hours of the reported throughput.

# **Clause 7 Related Items**

---

## **System Pricing**

*A detailed list of hardware and software used in the priced system must be reported. Each separately orderable item must have vendor part number, description, and release/revision level, and either general availability status or committed delivery data. If package-pricing is used, vendor part number of the package and a description uniquely identifying each of the components of the package must be disclosed. Pricing source and effective date(s) of price(s) must also be reported.*

*The total 3 year price of the entire configuration must be reported, including: hardware, software, and maintenance charges. Separate component pricing is recommended. The basis of all discounts used must be disclosed.*

The details of the hardware and software are reported in the front of this report as part of the executive summary. All third party quotations are included at the end of this report as Appendix E.

## **Availability, Throughput, and Price Performance**

*The committed delivery date for general availability (availability date) of products used in the price calculation must be reported. When the priced system included products with different availability dates, the reported availability date for the priced system must be the date at which all components are committed to be available.*

*A statement of the measured tpmC as well as the respective calculations for the 3-year pricing, price/performance (price/tpmC), and the availability date must be included.*

• Maximum Qualified Throughput	<b>19,526.27tpmC</b>
• Price per tpmC	<b>\$2.25 per tpmC</b>
• Availability	<b>May 12, 2003</b>

## **Country Specific Pricing**

*Additional Clause 7 related items may be included in the Full Disclosure Report for each country specific priced configuration. Country specific pricing is subject to Clause 7.1.7*

This system is being priced for the United States of America.

## **Usage Pricing**

*For any usage pricing, the sponsor must disclose:*

- Usage level at which the component was priced.
- A statement of the company policy allowing such pricing.

The component pricing based on usage is shown below:

- 1 Microsoft Windows 2000 Server
- 1 Microsoft Windows Server 2003
- 1 Microsoft SQL Server 2000 (per processor)
- 1 Microsoft Visual C++
- HP Servers include 3 years of support.

**PERFORMANCE METRICS INC.**  
TPC Certified Auditors

March 31, 2003

Mr. Paul Cao  
Hewlett-Packard Company  
20555 SH 249  
Houston, TX 77070

I have verified on by remote the TPC Benchmark™ C client/server for the following configuration:

Platform: ProLiant ML350T03  
Database Manager: Microsoft SQL Server 2000 Standard Edition  
Operating System: Microsoft Windows Server 2003 Standard Edition  
Transaction Monitor: Microsoft COM+

Servers: ProLiant mL350 with:				
CPU's	Memory	Disks (total)	90% Response	TpmC
1 Pentium Xeon @ 2.8 Ghz	Main: 2 GB Cache: 512 KB	42 @ 18GB 4 @ 36GB	1.04	19,526.27
1 Client: DL360R each with:				
2 Pentium Xeon @ 1.4 Ghz	Main: 1 GB Cache: 512 KB	1 @ 18 GB	Na	Na

In my opinion, these performance results were produced in compliance with the TPC requirements for the benchmark. The following attributes of the benchmark were given special attention:

- The transactions were correctly implemented.
- The database files were properly sized and populated.
- The database was properly scaled with 1,610 warehouses of which 1,580 were active during the performance run.
- The ACID properties were successfully demonstrated.

**PERFORMANCE METRICS INC.**  
**TPC Certified Auditors**

---

- The log loss and data loss durability test were demonstrated on a subset of the configured system using 1,550 warehouses.
- Input data was generated according to the specified percentages.
- Eight hours of mirrored log space was present on the tested system.
- Eight hours of growth space for the dynamic tables was present on the tested system.
- The data for the 60 day space calculation was verified.
- The controller cache was disabled on the log disk controllers.
- The steady state portion of the test was 120 minutes.
- One checkpoint was taken before the measured interval.
- Four checkpoints were taken during the measured interval.
- The system pricing was checked for major components and maintenance.
- Third party quotes were verified for compliance.

Auditor Notes: None.

Sincerely,

**Lorna Livingtree**  
Auditor

CFG=db_odbc_dll - Win32 IceCAP
!MESSAGE This is not a valid makefile. To build this
project using NMAKE,
!MESSAGE use the Export Makefile command and run
!MESSAGE
!MESSAGE NMAKE /f "db_odbc_dll.mak".
!MESSAGE
!MESSAGE You can specify a configuration when running
NMAKE
!MESSAGE by defining the macro CFG on the command
line. For example:
!MESSAGE
!MESSAGE NMAKE /f "db_odbc_dll.mak" CFG="db_odbc_dll
- Win32 IceCAP"
!MESSAGE
!MESSAGE Possible choices for configuration are:
!MESSAGE
!MESSAGE "db_odbc_dll - Win32 Release" (based on
"Win32 (x86) Dynamic-Link Library")
!MESSAGE "db_odbc_dll - Win32 Debug" (based on "Win32
(x86) Dynamic-Link Library")
!MESSAGE "db_odbc_dll - Win32 IceCAP" (based on
"Win32 (x86) Dynamic-Link Library")
!MESSAGE

*****
* Spinlock and Semaphore locking.
* This class provides a very
conservative locking scheme.
* The assumption behind the code is that
locks will be
* held for a very short time. When a
lock is taken a memory
* location is exchanged. All other
threads that want this
* lock wait by spinning and sometimes
sleeping on a semaphore
* until it becomes free again. The only
other choice is not
* to wait at all and move on to do
something else. This
* module should normally be used in
conjunction with cache
* aligned memory to minimize cache line
misses.
*

# Microsoft Developer Studio Project File -
Name="tpcc_com_all" - Package Owner=<4>
# Microsoft Developer Studio Generated Build File,
Format Version 6.00
# ** DO NOT EDIT **

# TARGTYPE "Win32 (x86) Dynamic-Link Library" 0x0102

CFG=tpcc_com_all - Win32 Debug
!MESSAGE This is not a valid makefile. To build this
project using NMAKE,
!MESSAGE use the Export Makefile command and run
!MESSAGE
!MESSAGE NMAKE /f "tpcc_com_all.mak".
!MESSAGE
!MESSAGE You can specify a configuration when running
NMAKE
!MESSAGE by defining the macro CFG on the command
line. For example:
!MESSAGE
!MESSAGE NMAKE /f "tpcc_com_all.mak"
CFG=tpcc_com_all - Win32 Debug
!MESSAGE
!MESSAGE Possible choices for configuration are:
!MESSAGE
!MESSAGE "tpcc_com_all - Win32 Release" (based on
"Win32 (x86) Dynamic-Link Library")
!MESSAGE "tpcc_com_all - Win32 Debug" (based on
"Win32 (x86) Dynamic-Link Library")
!MESSAGE

# Microsoft Developer Studio Project File -
Name="tpcc_com_ps" - Package Owner:<4>
# Microsoft Developer Studio Generated Build File,
Format Version 6.00
# ** DO NOT EDIT **

# TARGTYPE "Win32 (x86) Application" 0x0101

CFG=tpcc_com_ps - Win32 Debug
!MESSAGE This is not a valid makefile. To build this
project using NMAKE,
!MESSAGE use the Export Makefile command and run
!MESSAGE
!MESSAGE NMAKE /f "tpcc_com_ps.mak".
!MESSAGE
!MESSAGE You can specify a configuration when running
NMAKE
!MESSAGE by defining the macro CFG on the command
line. For example:
!MESSAGE
!MESSAGE NMAKE /f "tpcc_com_ps.mak" CFG="tpcc_com_ps
- Win32 Debug"
!MESSAGE
!MESSAGE Possible choices for configuration are:
!MESSAGE
!MESSAGE "tpcc_com_ps - Win32 Release" (based on
"Win32 (x86) Application")
!MESSAGE "tpcc_com_ps - Win32 Debug" (based on "Win32
(x86) Application")
!MESSAGE

*               All Rights Reserved
*
*               Version
4.10.000 audited by Richard Gimarc, Performance
Metrics, 3/17/99
*
*               PURPOSE: Implements dbllib calls for TPC-C
txns.
*               Contact: Charles Levine
(clevine@microsoft.com)
*
*               Change history:
*               4.20.000 - updated rev number to
match kit
*               4.10.001 - not deleting error
class in catch handler on deadlock retry;
*               not a
functional bug, but a memory leak
*               - had to
tweak some declarations to compile with latest SDK;
no functional change

// Function name: MakeAlphaString
//
//=====

//philipdu 08/13/96 Changed MakeAlphaString to use A-Z, a-z, and 0-9 in
//accordance with spec see below:
//The spec says:
//4.3.2.2 The notation random a-string [x .. y]
//(respectively, n-string [x .. y]) represents a string of random alphanumeric
//(respectively, numeric) characters of a random length of minimum x, maximum y,
//and mean (y+x)/2. Alphanumerics are A..Z, a..z, and 0..9. The only other
//requirement is that the character set used "must be able to represent a minimum
//of 128 different characters". We are using 8-bit chars, so this is a non issue.
//It is completely unreasonable to stuff non-printing chars into the text fields.
// -CLevine 08/13/96

## **version.sql**

```

-- File:      VERSION.SQL
--           Microsoft TPC-C Benchmark Kit Ver. 4.22
--           Copyright Microsoft, 2001
-- Purpose:   Returns version level of TPC-C stored procs
-- Note:      Always update the return value of this proc for
--           any interface changes or "must have" bug fixes.

-- The value returned by this SP defines the "interface level",
-- which must match between the stored procs and the client code.
-- The interface level may be down rev from the current kit. This
-- indicates that the interface hasn't changed since that version.

## **null-txns.sql**

```

-- TPC-C Null Txn Stored Procs
-- Microsoft TPC-C Kit
-- 8/17/99
--
-- This script will create stored procs which accept the same parameters and return
-- correctly formed
-- results sets to match the standard TPC-C stored procs. Of course, the advantage
-- is that these

```

```

-- stored procs place almost no load on SQL Server and do not require a database.
--
-- The purpose of these stored procs is to size and test the web client without the
need of a fully
-- scaled database.
--

## **Appendix C: Tunable Parameters**

### **Microsoft SQL Server 2000 Startup Parameters**

```
C:\Program Files\Microsoft SQL
Server\MSSQL\BINN\sqlservr.exe
-eC:\Program Files\Microsoft SQL
Server\MSSQL\LOG\ERRORLOG -x -c -t3502
```

Where:

- c Start SQL Server independently of the Windows NT Service Control Manager
- x Disables the keeping of CPU time and cache-hit ratio statistics
- t3502 Prints a message to the SQL Server log at the start and end of each checkpoint

### **Boot.ini Parameters**

```
[boot loader]
timeout=30
default=multi(0)disk(0)rdisk(0)partition(2)\WINNT
[operating systems]
multi(0)disk(0)rdisk(0)partition(2)\WINNT="Microsoft
Windows 2000 Server" /fastdetect
```

### **Microsoft SQL Server 2000**

## **Configuration Parameters**

```
-- File: CONFIG.SQL

## Microsoft SQL Server 2000 Installation Procedures

Microsoft SQL Server 2000 Installation Procedures  
Type of installation: custom  
During the custom installation, use the default settings for all except the following two areas:  
Services accounts:  
SQL Server - local system account  
SQL Server Agent - local system account  
Set the sort order/collation as SQL Collation binary  
sort order/Latin\_1\_General

## Microsoft COM Component Configuration Parameters

The component services tool in Windows 2000 was used to change the queue settings for the TPCC COM+ single queue component. The single queue component was set to enable object pooling, object construction, just in time activation, and component supports events and statistics. The min and max pool size for the single queue component on the client was 236. Delivery threads were set under the TPCC key in the registry. The construction string was Dummy String

Hewlett-Packard  
Company  
Paul Cao  
MS150402  
20555 SH 249  
Houston, TX 77070

Mr. Cao:

Here is the information you requested regarding pricing for several Microsoft products to be used in conjunction with your TPC-C benchmark testing.

All pricing shown is in US Dollars (\$).

Part Number	Description	Unit Price	Quantity	Price
228-01079	<b>SQL Server 2000 Standard Edition</b> <i>Per processor licensing No discounts applied</i>	\$4,999	1	\$4,999
C11-00821	<b>Windows 2000 Server</b> <i>Server license only - No CALs Discount Schedule: Open Program - No Level Unit Price reflects a 8% discount from the retail unit price of \$799.</i>	\$738	1	\$738
P73-00295	<b>Windows Server 2003, Standard Server</b> <i>Server license only - No CALs Discount Schedule: Open Program - No Level Unit Price reflects a 26% discount from the retail unit price of \$999.</i>	\$738	1	\$738
PRO-PRORS-16U-01	<b>Database Server Support Package</b> <i>1 Year Term</i>	\$1,950	3	\$5,850

Some products may not be currently orderable but will be available through Microsoft's normal distribution channels by April 2, 2003.

This quote is valid for the next 90 days.

If we can be of any further assistance, please contact Jamie Reding at  
(425) 703-0510 or [jamiere@microsoft.com](mailto:jamiere@microsoft.com).
