**Submitted for review  
August 1997**

## First Edition - August 1997

Unisys Corporation believes that the information in this document is accurate as of the publication date. The information in this document is subject to change without notice. Unisys Corporation assumes no responsibility for any errors that may appear in this document.

The pricing information in this document is believed to accurately reflect the current prices as of the publication date. However, Unisys Corporation and Microsoft Corporation provide no warranty on the pricing information in this document.

Benchmark results are highly dependent upon workload, specific application requirements, and systems design and implementation. Relative system performance will vary as a result of these and other factors. Therefore, TPC Benchmark C should not be used as a substitute for a specific customer application benchmark when critical capacity planning and/or product evaluation decisions are contemplated.

All performance data contained in this report was obtained in a rigorously controlled environment, and therefore results obtained in other operating environments may vary significantly. Unisys Corporation and Microsoft Corporation do not warrant or represent that a user can or will achieve similar performance expressed in transactions per minute (tpmC) or normalized price/performance (\$/tpmC). No warranty of system performance or price/performance is expressed or implied in this report.

Unisys uses an 11-digit document numbering system. The suffix of the document number (1234 5678-xyz) indicates the document level. The first digit of the suffix (x) designates a revision level; the second digit (y) designates an update level. For example, the first release of a document has a suffix of -000. A suffix of -130 designates the third update to revision 1. The third digit (z) is used to indicate an errata for a particular level and is not reflected in the page status summary.

## **Overview**

This report documents the methodology and results of the TPC Benchmark C (TPC-C) conducted on the Unisys Corporation Aquanta HS/6 server. The operating system on the server was Microsoft Windows NT Server 4.0 Enterprise Edition. The DBMS used was Microsoft SQL Server 6.5 Enterprise Edition SP4. The operating system on the clients was Microsoft Windows NT Server 4.0 SP2. The clients ran Microsoft's Internet Information Server 3.0 and Tuxedo 6.3 CFS for NT.

## **TPC Benchmark Metrics**

The standard TPC Benchmark C metrics, ipmC (transactions per minute), price per ipmC (five year capital cost per measured ipmC), and the availability date are reported as required by the benchmark specification.

## **Executive Summary**

The following pages contain the executive summary results of the benchmark.

## **Auditor**

The benchmark configuration, environment, and methodology used to produce and validate the test results, along with the pricing model used to calculate the cost per ipmC, were audited by Richard Gimarc of Performance Metrics, Inc. to verify compliance with the relevant TPC specification.

| Prices used in TPC benchmarks reflect the actual prices a customer would pay for a one-time purchase of the stated components. Individually negotiated discounts are not permitted. Special prices based on assumption about past or future purchases are not permitted. All discounts reflect standard pricing policies for the listed components. For complete details, see the pricing sections of the TPC benchmarks specifications. If you find that the stated prices are not available according to these terms, please inform the TPC at pricing@tpc.org. |                 |                           |            |      |                  |                 |

# NUMERICAL QUANTITIES SUMMARY

Unisys Aquanta HS/6 Server  
Microsoft SQL Server 6.5 Enterprise Edition

**MQTh, Computed Maximum Qualified Throughput:** **12026.07**  
 % throughput difference, reported & reproducibility runs: 0.87%

**Transaction Mix**

|              |        |
|--------------|--------|
| New Order    | 44.72% |
| Payment      | 43.09% |
| Delivery     | 4.08%  |
| Stock-Level  | 4.03%  |
| Order-Status | 4.08%  |

**Response Times**

| Transaction         | Average | Maximum | 90th %ile |
|---------------------|---------|---------|-----------|
| New-Order           | 0.83    | 23.75   | 1.14      |
| Payment             | 0.92    | 23.03   | 1.10      |
| Delivery            | 0.47    | 8.41    | 0.70      |
| Stock-Level         | 2.58    | 25.94   | 4.29      |
| Order Status        | 1.35    | 26.21   | 1.95      |
| Menu                | 0.20    | 1.41    | 0.30      |
| Delivery (Deferred) | 0.77    | 14.77   | 0.99      |

**Response time delay added for emulated components (seconds)**

|                    |     |
|--------------------|-----|
| RT Response time   | 0.1 |
| Menu Response time | 0.1 |

**Keying/Think Time Times (seconds)**

| Transaction  | Minimum | Average     | Maximum   |
|--------------|---------|-------------|-----------|
| New-Order    | 18.00/0 | 18.01/12.23 | 19.16/120 |
| Payment      | 3.00/0  | 3.01/12.23  | 4.12/120  |
| Delivery     | 2.00/0  | 2/5.11      | 3.01/50   |
| Stock-Level  | 2.00/0  | 2/5.08      | 3.11/50   |
| Order-Status | 2.00/0  | 2/10.22     | 3.13/100  |

**Test Duration**

|                                                                |            |
|----------------------------------------------------------------|------------|
| Ramp up time                                                   | 35 minutes |
| Measurement interval (M)                                       | 30 minutes |
| Transactions (all types) completed during measurement interval | 8067/06    |
| Ramp-down time                                                 | 13 minutes |

**Checkpointing:**

|                       |            |
|-----------------------|------------|
| Number of checkpoints | 1          |
| Checkpoint interval   | 30 minutes |

| 2.5. Transaction Statistics.....                              | 2-1        |
| 2.6. Queuing Mechanism of Delivery.....                       | 2-2        |
| <b>3. Clause 3: Transaction &amp; System Properties .....</b> | <b>3-1</b> |
| 3.1. Transaction System Properties (ACID).....                | 3-1        |
| 3.2. Atomicity.....                                           | 3-1        |
| 3.2.1. Completed Transaction .....                            | 3-1        |
| 3.2.2. Aborted Transactions .....                             | 3-1        |
| 3.3. Consistency .....                                        | 3-1        |
| 3.4. Isolation.....                                           | 3-2        |

|                                                                       |            |
|-----------------------------------------------------------------------|------------|
| 3.5. Durability .....                                                 | 3-2        |
| 3.5.1. Loss of Log and Loss of Data Disk .....                        | 3-2        |
| 3.5.2. Instantaneous Interruption and Loss of Memory .....            | 3-3        |
| <b>4. Clause 4: Scaling &amp; Database Population .....</b>           | <b>4-1</b> |
| 4.1. Initial Cardinality of Tables .....                              | 4-1        |
| 4.2. Constant Values .....                                            | 4-1        |
| 4.3. Database Layout .....                                            | 4-1        |
| 4.4. DBMS: Data Model and DBMS Interface/Access Language .....        | 4-2        |
| 4.5. DBMS Partitions/Replications .....                               | 4-2        |
| 4.6. DBMS Space Requirements .....                                    | 4-2        |
| <b>5. Clause 5: Performance Metrics &amp; Response Time .....</b>     | <b>5-1</b> |
| 5.1. Measured Throughput (tpmC) .....                                 | 5-1        |
| 5.2. Response Times .....                                             | 5-1        |
| 5.3. Keying and Think Times .....                                     | 5-1        |
| 5.4. Response Time Frequency Distribution Curves .....                | 5-2        |
| 5.5. New Order Think Time Frequency Distribution Curve .....          | 5-4        |
| 5.6. Response Time versus Throughput Performance Curve .....          | 5-5        |
| 5.7. New-Order Throughput vs. Time .....                              | 5-6        |
| 5.8. Determination of “Steady State” .....                            | 5-6        |
| 5.9. Work Performed During Steady State .....                         | 5-6        |
| 5.10. Reproducibility .....                                           | 5-7        |
| 5.11. Measurement Interval Duration .....                             | 5-7        |
| 5.12. Regulation of Transaction Mix .....                             | 5-7        |
| 5.13. Transaction Statistics .....                                    | 5-8        |
| 5.14. Checkpoint Statistics .....                                     | 5-8        |
| <b>6. Clause 6: SUT, Driver &amp; Communications Definition .....</b> | <b>6-1</b> |
| 6.1. Remote Terminal Emulator (RTE) Description .....                 | 6-1        |
| 6.2. Emulated Components .....                                        | 6-1        |
| 6.3. Functional Diagrams .....                                        | 6-1        |
| 6.4. Network Configuration .....                                      | 6-1        |
| 6.5. Network Bandwidth .....                                          | 6-1        |
| 6.6. Operator Intervention .....                                      | 6-2        |
| <b>7. Clause 7: Pricing .....</b>                                     | <b>7-1</b> |
| 7.1. Pricing .....                                                    | 7-1        |
| 7.1.1. System Pricing .....                                           | 7-1        |
| 7.1.2. Maintenance Pricing .....                                      | 7-1        |
| 7.1.3. Discounts .....                                                | 7-1        |
| 7.2. Availability .....                                               | 7-2        |
| 7.3. Measured tpmC, Price/Performance, and Availability Date .....    | 7-2        |

|                                                  |     |
|--------------------------------------------------|-----|
| 7.4. Country-Specific Pricing .....              | 7-2 |
| 7.5. Usage Pricing .....                         | 7-2 |
| 8. Clause 8 : Full Disclosure Availability ..... | 8-1 |
| 8.1. Availability .....                          | 8-1 |
| 9. Clause 9 : Audit .....                        | 9-1 |
| 9.1. Auditor's Report .....                      | 9-1 |
| Appendix A - Client/Server Source .....          | A-1 |
| Appendix B - Database Design .....               | B-1 |
| Appendix C - Tunable Parameters .....            | C-1 |
| Appendix D - RTE Code .....                      | D-1 |
| Appendix F - Third-Party Price Quotations .....  | F-1 |

## **Document Structure**

The TPC Benchmark C Standard Specification requires test sponsors to publish, submit to the TPC, and make available to the public, a full disclosure report for any result to be considered compliant with the specification. The required contents of the full disclosure report are specified in Clause 8.

This report is submitted to satisfy the specification's requirement for full disclosure. It documents the compliance of the benchmark implementation and execution reported for the Unisys Corporation Aquanta HS/6 Server using Microsoft SQL Server 6.5 Enterprise Edition.

## **TPC Benchmark C Overview**

The TPC Benchmark™ C Standard Specification Revision 3.3.1 was developed by the Transaction Processing Council (TPC). It is the intent of the TPC to develop a suite of benchmarks to measure the performance of computer systems executing a wide range of applications. Unisys and Microsoft Corporations are active participants in the TPC to define and develop such a suite of benchmarks.

TPC Benchmark™ C (TPC-C) is an OLTP workload. It is a mixture of read-only and update intensive transactions that simulate the activities found in complex OLTP application environments. It does so by exercising a breadth of system components associated with such environments, which are characterized by:

- The simultaneous execution of multiple transaction types that span a breadth of complexity.
- On-line and deferred transaction execution modes.
- Multiple on-line terminal sessions.
- Moderate system and application execution time.
- Significant disk input/output.
- Transaction integrity (ACID properties).
- Non-uniform distribution of data access through primary and secondary keys.
- Databases consisting of many tables with a wide variety of sizes, attributes, and relationships.
- Contention on data access and update.

The performance metric reported by TPC-C is a "business throughput" measuring the number of orders processed per minute. Multiple transactions are used to simulate the business activity of processing an order, and each transaction is subject to a response time constraint. The performance metric for this benchmark is expressed in transactions-per-minute-C (tpmC). To be compliant with the TPC-C standard, all references to tpmC results must include the tpmC rate, the associated price-per-tpmC, and the availability date of the priced configuration.

Despite the fact that this benchmark offers a rich environment that emulates many OLTP environments, this benchmark does not reflect the entire range of OLTP requirements. In addition, the extent to which a customer can achieve the results reported by a vendor is highly dependent on how closely TPC-C approximates the customer application. The relative performance of systems derived from this benchmark does not necessarily hold for other workloads or environments. Extrapolations to any other environment are not recommended.

## **0.1. Order and Titles**

*The order and titles of sections in the Test Sponsor's Full Disclosure report must correspond with the order and titles of sections from the TPC-C standard specification (i.e., this document). The intent is to make it as easy as possible for readers to compare and contrast material in different Full Disclosure reports.*

The order and titles of the sections in this report correspond with those from the TPC-C standard specification.

## **0.2. Executive Summary Statement**

*The TPC Executive Summary Statement must be included near the beginning of the Full Disclosure report.*

The TPC Executive Summary Statement is included near the beginning of this report.

## **0.3. Numerical Quantities Summary**

*The numerical quantities listed below must be summarized near the beginning of the Full Disclosure report :*

- *measurement interval in minutes,*
- *number of checkpoints in the measurement interval,*
- *checkpoint interval in minutes,*
- *number of transactions (all types) completed within the measurement interval,*
- *computed Maximum Qualified Throughput in tpmC,*
- *percentage difference between reported throughput and throughput obtained in reproducibility run,*
- *ninetieth percentile, average and maximum response times for the New-Order, Payment, Order-Status, Stock-Level, Delivery (deferred and interactive) and Menu transactions,*
- *time in seconds added to response time to compensate for delays associated with emulated components,*
- *percentage of transaction mix for each transaction type.*

These numerical quantities are summarized near the beginning of this report.

## **0.4. Application Code Disclosure**

*The applicable program (as defined in Clause 2.1.7) must be disclosed. This includes, but is not limited to, the code implementing the five transactions and the terminal input and output functions.*

Appendix A contains the client application code used in this TPC-C benchmark. Appendix B contains the SQL stored procedures which implement the TPC-C transactions.

## 0.5. Benchmark Sponsor

*A statement identifying the benchmark sponsor(s) and other participating companies must be provided.*

This TPC benchmark C was sponsored by Unisys Corporation. The benchmark test was developed by Microsoft and Unisys. The benchmark was conducted at Unisys, Mission Viejo, California.

## 0.6. Parameter Settings

*Settings must be provided for all customer-tunable parameters and options which have been changed from the defaults found in actual products, including but not limited to:*

- *Data Base tuning options*
- *Recovery/commit options*
- *Consistency/locking options*
- *Operating system and application configuration parameters*

Appendix C contains the configuration and system parameters used in running these TPC-C tests. It also contains all the client and server OS, and SQL Server tunable parameters.

## 0.7. Configuration Diagrams

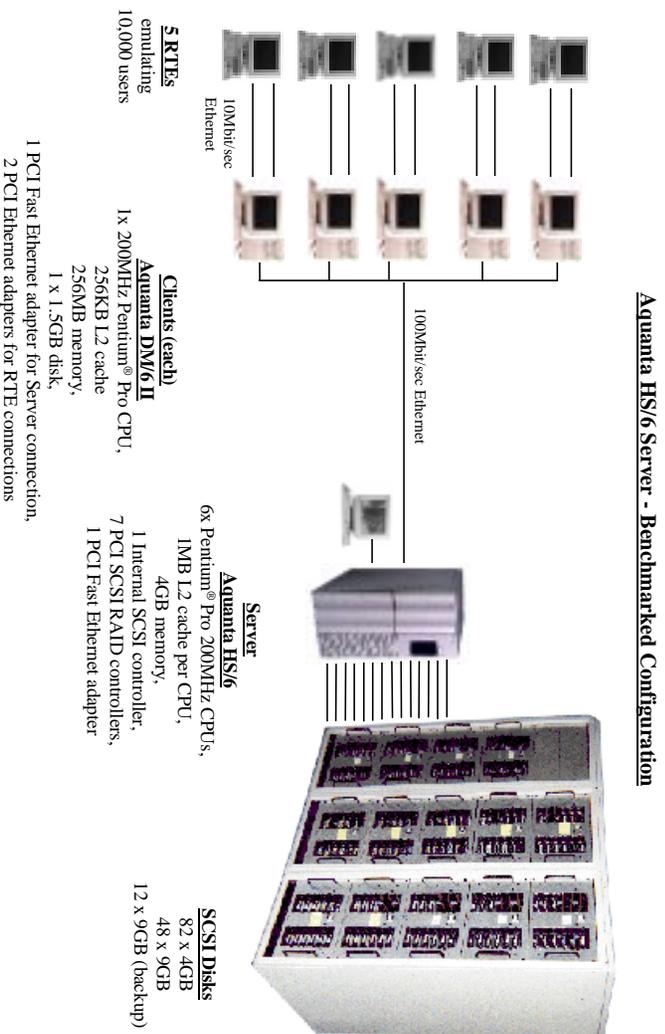

*Diagrams of both measured and priced configurations must be provided, accompanied by a description of the differences. This includes, but is not limited to:*

- *Number and type of processors.*
- *Size of allocated memory; and any specific mapping/partitioning of memory unique to the test.*
- *Number and type of disk units (and controllers, if applicable).*
- *Number of channels or bus connections to disk units, including their protocol type.*
- *Number of LAN (e.g., Ethernet) connections, including routers, workstations, terminals, etc., that were physically used in the test or are incorporated into the pricing structure (see Clause 8.1.8).*
- *Type and the run-time execution location of software components (e.g., DBMS, client processes, transaction monitors, software drivers, etc.).*

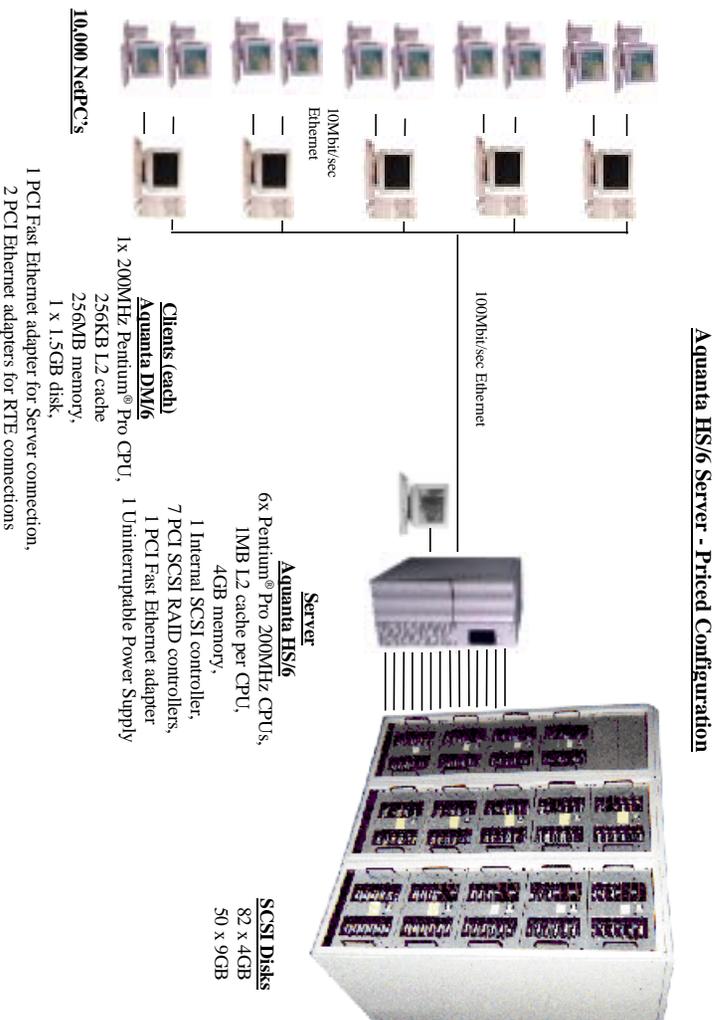

The Remote Terminal Emulator (RTE) software used for these TPC-C tests is proprietary to Unisys. The benchmarked configuration of the RTE and Aquanta HS/6 server is illustrated in Figure 0.1. Tables 4.3, 4.4 and 4.5 contain a detailed explanation of the disk configuration.

The priced configuration for the Aquanta HS/6 server is shown in Figure 0.2.

**Figure 0.1: Benchmarked Configuration**

**Figure 0.2: Priced Configuration**

# 1.

## ***Clause 1: Logical Database Design***

---

### **1.1. Table Definitions**

*Listings must be provided for all table definition statements and all other statements used to setup the data base.*

Appendix B contains the SQL definitions of all the required database devices, tables, indexes and stored procedures, plus a listing of the program used to load the database and establish the required initial populations of each table.

### **1.2. Physical Organization of the Database**

*The physical organization of tables and indices, within the data base, must be disclosed.*

The disk space was allocated to SQL Server according to the data in Table 4.4. The SQL definitions are contained in Appendix B.

### **1.3. Insert and/or Delete Operations**

*It must be ascertained that insert and/or delete operations to any of the tables can occur concurrently with the TPC-C transaction mix. Furthermore, any restriction in the SUT data base implementation that precludes inserts beyond the limits defined in Clause 1.4.11 must be disclosed. This includes the maximum number of rows that can be inserted and the maximum key value for these new rows.*

There were no restrictions on insert and/or delete operations to any of the tables.

### **1.4. Partitioning**

*While there are few restrictions placed upon horizontal or vertical partitioning of tables and rows in the TPC-C benchmark, any such partitioning must be disclosed.*

Partitioning was not used for any table in this implementation.

### **1.5. Replication, Duplication or Additions**

*Replication of tables, if used, must be disclosed.*

*Additional and/or duplicate attributes in any table must be disclosed along with a statement on the impact on performance.*

No replications, duplications or additional attributes were used in this implementation.

## **2. Clause 2: Transaction & Terminal Profiles**

### **2.1. Random Number Generation**

*The method of verification for the random number generation must be disclosed.*

The drivers used the Unisys RTE program, which was independently audited. The initial population of the database was performed by the loader program from V3-02 of the Microsoft TPC-C toolkit, which was also independently audited. Furthermore, the auditor sampled various initial and runtime distributions produced by this implementation to verify correctness.

### **2.2. Input/Output Screen Layout**

*The actual layout of the terminal input/output screens must be disclosed.*

The screen layouts are based on those in Clauses 2.4.3, 2.5.3, 2.6.3, 2.7.3, and 2.8.3 of the TPC Benchmark C Standard Specification. There are some minor differences in appearance due to the use of a web client implementation.

### **2.3. Priced Terminal Feature Verification**

*The method used to verify that the emulated terminals provide all the features described in Clause 2.2.2.4 must be explained. Although not specifically priced, the type and model of the terminals used for the demonstration in 8.1.3.3 must be disclosed and commercially available (including supporting software and maintenance).*

This was verified by the auditor by a direct experiment during the onsite audit portion of this benchmark, using Microsoft Internet Explorer 3.0 as the web browser.

### **2.4. Presentation Managers or Intelligent Terminal**

*Any usage of presentation managers or intelligent terminals must be explained.*

Application code running on the client implemented the TPC-C user interface. A listing of this code is included in Appendix A. No presentation manager was used on the client, as screen manipulation and data input/output was handled for each user by the Microsoft Internet Explorer web browser running on each user PC.

### **2.5. Transaction Statistics**

*The percentage of New-Order transactions that were rolled back as a result of an unused item number must be disclosed.*

*The number of items per order entered by New-Order transactions must be disclosed.*

*The percentage of home and remote Payment transactions must be disclosed.*

*The percentage of Payment and Order-Status transactions that used non-primary key (C\_LAST) access to the database must be disclosed.*

*The percentage of Delivery transactions that were skipped as a result of an insufficient number of rows in the NEW-ORDER table must be disclosed.*

*The mix (i.e., percentages) of transaction types seen by the SUT must be disclosed.*

Table 2.1 contains all these statistics.

**Table 2.1: Transaction Statistics**

| <b>Transaction Type</b> | <b>Statistics</b>                     | <b>Value</b> |
|-------------------------|---------------------------------------|--------------|
| New Order               | Rolledback transactions               | 1.00%        |
|                         | Home warehouse                        | 99.00%       |
|                         | Remote warehouse                      | 1.00%        |
|                         | Average Items per Order               | 10.00        |
| Payment                 | Home warehouse                        | 85.03%       |
|                         | Remote warehouse                      | 14.97%       |
|                         | Non-primary key access                | 60.06%       |
| Order Status            | Non-primary key access                | 60.06%       |
| Delivery                | Skipped transactions (Interactive)    | 0            |
|                         | Skipped transaction counts (Deferred) | 0            |
|                         | Skipped District counts (Deferred)    | 0            |
| Transaction Mix         | New Order                             | 44.72%       |
|                         | Payment                               | 43.09%       |
|                         | Delivery                              | 4.08%        |
|                         | Stock-Level                           | 4.03%        |
|                         | Order-Status                          | 4.08%        |

## 2.6. Queuing Mechanism of Delivery

*The queuing mechanism used to defer execution of the Delivery transaction must be disclosed.*

Tuxedo provides the queue for delivery servers. The client application process posts delivery transactions to the delivery queue using a Tuxedo asynchronous call with the TPNOReply option. Upon return from this call, the client application provides a 'delivery queued' response to the user. Delivery servers independently retrieve messages from their queue, submit them to the data base for processing, and log the result to a file upon completion. The source code for this delivery process is included in Appendix A.

## **3. Clause 3: Transaction & System Properties**

### **3.1. Transaction System Properties (ACID)**

*The results of the ACID tests must be disclosed along with a description of how the ACID requirements were met. This includes disclosing which case was followed for the execution of Isolation Test 7.*

The TPC Benchmark C Standard Specification defines a set of transaction processing system properties that a system under test (SUT) must support during the execution of the benchmark. Those properties are Atomicity, Consistency, Isolation, and Durability (ACID).

This section defines each of these properties, describes the steps taken to ensure that they were present during the test and describes a series of tests done to demonstrate compliance with the specification. All ACID property tests were executed successfully.

### **3.2. Atomicity**

*The system under test must guarantee that data base transactions are atomic; the system will either perform all individual operations on the data, or will assure that no partially-completed operations leave any effects on the data.*

#### **3.2.1. Completed Transaction**

*Perform the Payment transaction for a randomly selected warehouse, district, and customer (by customer number) and verify that the records in the CUSTOMER, DISTRICT, and WAREHOUSE tables have been changed appropriately.*

The balances from a randomly selected warehouse, district, and customer row were retrieved by customer number from a script. A Payment transaction was submitted with the same warehouse, district and customer identifiers for a known amount. After completion of the Payment transaction, the balances of the selected warehouse, district, and customer were again retrieved to verify that the changes had been made correctly.

#### **3.2.2. Aborted Transactions**

*Perform the Payment transaction for a randomly selected warehouse, district, and customer (by customer number) and substitute a ROLLBACK of the transaction for the COMMIT of the transaction. Verify that the records in the CUSTOMER, DISTRICT, and WAREHOUSE tables have NOT been changed.*

The balances from a randomly selected warehouse, district, and customer row were retrieved by customer number from a script. A Payment transaction was submitted with the same warehouse, district and customer identifiers that issued a ROLLBACK command rather than a COMMIT. After the transaction completed, the balances of the selected warehouse, district, and customer were again retrieved to verify that no changes had been made to the database.

### **3.3. Consistency**

*Consistency is the property of the application that requires any execution of a data base transaction to take the data base from one consistent state to another, assuming that the data base is initially in a consistent state.*

The benchmark specification requires explicit demonstration of the following four consistency conditions:

1. The sum of the district balances in a warehouse is equal to the warehouse balance;
2. For each district, the next order id minus one is equal to maximum order id in the ORDER table and equal to the maximum new order id in the NEW ORDER table;
3. For each district, the maximum order id minus minimum order id in the ORDER table plus one equals the number of rows in the NEW-ORDER table for that district;
4. For each district, the sum of the order line counts in the ORDER table equals the number of rows in the ORDER-LINE table for that district;

In order to demonstrate this consistency, the following steps were taken:

1. Prior to the start of a benchmark run, the consistency of the database was verified by testing successfully conditions 1-4 described above with a script.
2. A run under full user load was executed for over 10 minutes with a checkpoint during the run.
3. After completion of that test, the consistency of the database was again verified by successfully testing using the same consistency script as in step 1.

### 3.4. Isolation

*Sufficient conditions must be enabled at either the system or application level to ensure the required isolation defined above (clause 3.4.1) is obtained.*

The benchmark specification defines seven required tests to be performed to demonstrate that required levels of transaction isolation are met. These tests, described in Clauses 3.4.2.1 - 3.4.2.7, were all performed from a script and verified by the auditor. In Isolation Test 7, Case A was observed. In addition, the phantom tests and stock level tests were executed and verified to be successful.

### 3.5. Durability

*The tested system must guarantee durability: the ability to preserve the effects of committed transactions and insure data base consistency after recovery from any one of the failures listed in Clause 3.5.3.*

Three durability tests were executed to satisfy the requirements of the specification. The test for loss of memory and instantaneous interruption was combined and performed with a fully scaled database with 10,000 emulated users. The loss of log and loss of data tests were combined and performed on a separate ten warehouse database with 100 emulated users. To the best of our knowledge, these tests prove that the fully scaled configuration used for the throughput test would also meet all durability tests.

#### 3.5.1. Loss of Log and Loss of Data Disk

The following steps were taken (using a ten warehouse database on the SUT) to demonstrate durability in the case of loss of a log and subsequent loss of a data disk:

1. The database was backed up to extra disks on a dump device.
2. The D\_NEXT\_O\_ID fields for all rows in the district table were summed up to determine the initial count of orders present in the database.
3. The RTE was started with 100 users. On the driver systems, committed and rolled back New-Order transactions were recorded in a “success” file.
4. One of the mirrored hot-pluggable log disks was removed from the disk cabinet after five minutes of steady state.

5. Log disk mirroring is done by a RAID controller, so NT and SQL Server did not notice the disk loss. The benchmark run continued without interruption.
6. After another five minutes of running at steady state, a hot-pluggable database disk was removed from the disk cabinet.
7. NT and SQL Server encountered IO errors due to the missing disk and recorded these errors in the NT event log and SQL Server error log, respectively.
8. First, the RTEs and clients were stopped, then SQL Server was stopped, and finally the SUT was shutdown and restarted.
9. SQL Server was restarted and marked the database as 'suspect'. A dump of the transaction log was taken to extra disks on a dump device.
10. Next, scripts were executed to drop the database and all its devices. Then, SQL Server was shutdown again and the SUT shutdown.
11. A different data disk was inserted in the disk cabinet to replace the one removed. (The removed log disk was never replaced.) The RAID controller was used to recreate the stripe set containing the new data disk.
12. The SUT was restarted, and Disk Administrator was used to assign the proper drive letter to the new stripe set. SQL Server was then restarted and an empty database created. After space allocation had finished, the database was recovered by first reloading the entire initial database and log from backup, then by loading and applying the transaction log dump that was taken after the data disk failure. The latter step restored all committed transactions to the database.
13. Consistency condition 3 of Clause 3.3.2.3 was executed to verify database consistency.
14. Step 2 was repeated to determine the total number of orders. This number was subtracted from the count obtained previously in Step 2 to determine the number of additional orders added to the database.
15. The contents of the "success" files on the drivers were sampled to verify that the records in the "success" file for committed New-Order transactions had corresponding records in the ORDER table and no entries existed for rolled back transactions. Moreover, the counts were matched with those obtained in step 14.

### 3.5.2. Instantaneous Interruption and Loss of Memory

Instantaneous interruption and loss of memory tests were combined because the loss of power erased the contents of memory. This failure was induced by removing the primary power to the System Under Test while the benchmark was executing.

1. The D\_NEXT\_O\_ID fields for all rows in the district table were summed up to determine the initial count of orders present in the database (count1).
2. On the driver systems, committed and rolled back New-Order transaction were recorded in a "success" file.
3. The benchmark was executed at full load with 10,000 emulated users for a minimum of 10 minutes.
4. Immediately after execution of a checkpoint completed, the system's primary power was turned off.
5. The test was aborted on the driver and client systems, and the RTEs and clients were shutdown.
6. Power was restored to the SUT, the system rebooted, SQL Server was restarted, and automatic database recovery was performed. The database recovery uses the transaction log to reapply all committed transactions and rollback any (in progress) uncommitted transactions, so that the database disks are correct.
7. After recovery finished, Consistency Condition of Clause 3.3.2.3 (no gaps in NO\_O\_ID) was executed to verify that the database was consistent..
8. Next, samples of the contents of the "success" file on the driver were compared against corresponding rows of the ORDER table to verify that records in the "success" file for committed New-Order transactions had corresponding records in the ORDER table and no entries existed for rolled back transactions.
9. Finally, step 1 was repeated to determine the total number of orders (count2). Count2 minus count1 was not less than the number of committed New-Order records in the "success" file.

# 4.

## *Clause 4: Scaling & Database Population*

### 4.1. Initial Cardinality of Tables

*The Cardinality (e.g., the number of rows) of each table, as it existed at the start of the benchmark run, must be disclosed. If the database was over-scaled and inactive rows of the WAREHOUSE table were deleted (see Clause 4.2.2 and the Auditor's attestation letter) the cardinality of the WAREHOUSE table as initially configured and the number of rows deleted must be disclosed.*

The TPC-C database for this test was configured with 1000 warehouses. The cardinality of each table in the database is listed in Table 4.1

**Table 4.1: Initial Cardinality of Database Table**

| Table      | Occurrences |
|------------|-------------|
| Warehouse  | 1,000       |
| District   | 10,000      |
| Customer   | 30,000,000  |
| History    | 30,000,000  |
| Order      | 30,000,000  |
| New Order  | 9,000,000   |
| Order Line | 300,002,146 |
| Stock      | 100,000,000 |
| Item       | 100,000     |

### 4.2. Constant Values

The following values were used as the constant C input values to the NURand function during Build and Run time for this implementation.

**Table 4.2: Constant C for NURand**

| Function       | Value |
|----------------|-------|
| C_LAST (Build) | 123   |
| C_LAST (Run)   | 223   |

### 4.3. Database Layout

*The distribution of tables and logs across all media must be explicitly depicted for the tested and priced systems.*

Tables 4.3, 4.4 and 4.5 list the distribution of the database over 121 disks and the transaction log over four mirrored pairs of disks for the benchmark configuration. In addition, there was one disk containing Windows NT Enterprise Edition and SQL Server Enterprise Edition code and the Master database plus the paging file. Database backup used

an extra 12 disks. For Durability testing with a smaller 10 warehouse database, another 8 disks were used: 4 for the database, 2 for a mirrored log and 2 for backup. All these 20 extra disks were excluded from the priced configuration. Two extra database disks were added to the priced configuration to meet the 180-day spare required.

#### **4.4. DBMS: Data Model and DBMS Interface/Access Language**

A statement must be provided that describes:

1. *The data model implemented by the DBMS used (e.g., relational, network, hierarchical).*
2. *The database interface (e.g., embedded, call level) and access language (e.g., SQL, DLI, COBOL, read/write) used to implement the TPC-C transactions. If more than one interface/access language is used to implement TPC-C, each interface/access language must be described and a list of which interface/access language is used with which transaction type must be disclosed.*

Microsoft SQL Server 6.5 Enterprise Edition is a relational DBMS.

The client software interfaced to SQL Server through Stored Procedures invoked through Remote Procedure Calls embedded in the C application code. Specifically, DBLIB and TCP/IP sockets were used.

#### **4.5. DBMS Partitions/Replications**

*The mapping of database partitions/replications must be explicitly described.*

No table partitioning or replication was done.

#### **4.6. DBMS Space Requirements**

*Details of the 180 day space computation along with proof that the database is configured to sustain 8 hours of growth for dynamic tables (Order, Order-time, and History) must be disclosed (see Clause 4.2.3).*

Appendix E lists the space requirements for the 180-day space as well as the logical log space for eight hours.

Table 4.3: Disk Cage Configuration

Disk Cage Configuration for TPCC

| Adapter | Disk Cage Configuration for TPCC |            |            |            |            |
|---------|----------------------------------|------------|------------|------------|------------|
| 1       | Channel 1                        |            | Channel 2  |            |            |
|         | Left Side                        | Right Side | Left Side  | Right Side |            |
|         | 13 4GB                           | empty      | 13 empty   | empty      |            |
|         | 12 4GB                           | 4GB        | 12 4GB     | 4GB        |            |
|         | 11 4GB                           | 4GB        | 11 4GB     | 4GB        |            |
|         | 10 4GB                           | 4GB        | 10 4GB     | 4GB        |            |
|         | 9 4GB                            | 4GB        | 9 4GB      | 4GB        |            |
|         | 8 4GB                            | 4GB        | 8 4GB      | 4GB        |            |
|         | 6 4GB                            | empty      | 6 empty    | empty      |            |
|         | 4 4GB                            | 4GB        | 4 4GB      | 4GB        |            |
|         | 3 4GB                            | 4GB        | 3 4GB      | 4GB        |            |
|         | 2 4GB                            | 4GB        | 2 4GB      | 4GB        |            |
|         | 1 4GB                            | 4GB        | 1 4GB      | 4GB        |            |
|         | 0 4GB                            | 4GB        | 0 4GB      | 4GB        |            |
|         | 2                                | Channel 1  |            | Channel 2  |            |
|         |                                  | Left Side  | Right Side | Left Side  | Right Side |
|         |                                  | 13 9GB     | 9GB        | 13 9GB     | 9GB        |
|         |                                  | 12 4GB     | 4GB        | 12 4GB     | 4GB        |
|         |                                  | 11 4GB     | 4GB        | 11 4GB     | 4GB        |
|         |                                  | 10 4GB     | 4GB        | 10 4GB     | 4GB        |
|         |                                  | 9 4GB      | 4GB        | 9 4GB      | 4GB        |
|         |                                  | 8 4GB      | 4GB        | 8 4GB      | 4GB        |
|         |                                  | 6 9GB      | 9GB        | 6 9GB      | 9GB        |
|         |                                  | 4 4GB      | 4GB        | 4 4GB      | 4GB        |
| 3 4GB   |                                  | 4GB        | 3 4GB      | 4GB        |            |
| 2 4GB   |                                  | 4GB        | 2 4GB      | 4GB        |            |
| 1 4GB   |                                  | 4GB        | 1 4GB      | 4GB        |            |
| 0 4GB   |                                  | 4GB        | 0 4GB      | 4GB        |            |
| 3       |                                  | Channel 1  |            | Channel 2  |            |
|         |                                  | Left Side  | Right Side | Left Side  | Right Side |
|         |                                  | 13 empty   | 4GB        | 13 empty   | 4GB        |
|         |                                  | 12 4GB     | 9GB        | 12 4GB     | 9GB        |
|         |                                  | 11 4GB     | 9GB        | 11 4GB     | 9GB        |
|         |                                  | 10 4GB     | 9GB        | 10 4GB     | 9GB        |
|         |                                  | 9 4GB      | 9GB        | 9 4GB      | 9GB        |
|         |                                  | 8 4GB      | 9GB        | 8 4GB      | 9GB        |
|         |                                  | 6 4GB      | 4GB        | 6 4GB      | 4GB        |
|         |                                  | 4 4GB      | 9GB        | 4 4GB      | 9GB        |
|         | 3 4GB                            | 9GB        | 3 4GB      | 9GB        |            |
|         | 2 4GB                            | 9GB        | 2 4GB      | 9GB        |            |
|         | 1 4GB                            | 9GB        | 1 4GB      | 9GB        |            |
|         | 0 4GB                            | 9GB        | 0 4GB      | 9GB        |            |
|         | 4                                | Channel 1  |            | Channel 2  |            |
|         |                                  | Left Side  | Right Side | Left Side  | Right Side |
|         |                                  | 13 empty   | 4GB        | 13 empty   | 4GB        |
|         |                                  | 12 4GB     | 9GB        | 12 4GB     | 9GB        |
|         |                                  | 11 4GB     | 9GB        | 11 4GB     | 9GB        |
|         |                                  | 10 4GB     | 9GB        | 10 4GB     | 9GB        |
|         |                                  | 9 4GB      | 9GB        | 9 4GB      | 9GB        |
|         |                                  | 8 4GB      | 9GB        | 8 4GB      | 9GB        |
|         |                                  | 6 4GB      | 4GB        | 6 4GB      | 4GB        |
|         |                                  | 4 4GB      | 9GB        | 4 4GB      | 9GB        |
| 3 4GB   |                                  | 9GB        | 3 4GB      | 9GB        |            |
| 2 4GB   |                                  | 9GB        | 2 4GB      | 9GB        |            |
| 1 4GB   |                                  | 9GB        | 1 4GB      | 9GB        |            |
| 0 4GB   |                                  | 9GB        | 0 4GB      | 9GB        |            |
| 5       |                                  | Channel 1  |            | Channel 2  |            |
|         |                                  | Left Side  | Right Side | Left Side  | Right Side |
|         |                                  | 13 empty   | empty      | 13 empty   | empty      |
|         |                                  | 12 4GB     | 9GB        | 12 4GB     | 9GB        |
|         |                                  | 11 4GB     | 9GB        | 11 4GB     | 9GB        |

## 5. Clause 5: Performance Metrics & Response Time

### 5.1. Measured Throughput (tpmC)

*Measured tpmC must be reported.*

The measured tpmC was 12,026.07.

### 5.2. Response Times

*Ninetieth percentile, maximum and average response times must be reported for all transaction types as well as for the Menu response time.*

Table 5.1: Response Time Data

| Transaction         | Average | Maximum | 90th %ile |
|---------------------|---------|---------|-----------|
| New-Order           | 0.83    | 23.75   | 1.14      |
| Payment             | 0.92    | 23.03   | 1.10      |
| Delivery            | 0.47    | 8.41    | 0.70      |
| Stock-Level         | 2.58    | 25.94   | 4.29      |
| Order Status        | 1.35    | 26.21   | 1.95      |
| Menu                | 0.20    | 1.41    | 0.30      |
| Delivery (Deferred) | 0.77    | 14.77   | 0.99      |

### 5.3. Keying and Think Times

*The minimum, the average, and the maximum keying and think times must be reported for each transaction type.*

Table 5.2: Keying Times

| Transaction  | Minimum | Average | Maximum |
|--------------|---------|---------|---------|
| New-Order    | 18.00   | 18.01   | 19.16   |
| Payment      | 3.00    | 3.01    | 4.12    |
| Delivery     | 2.00    | 2.00    | 3.01    |
| Stock-Level  | 2.00    | 2.00    | 3.11    |
| Order Status | 2.00    | 2.00    | 3.13    |

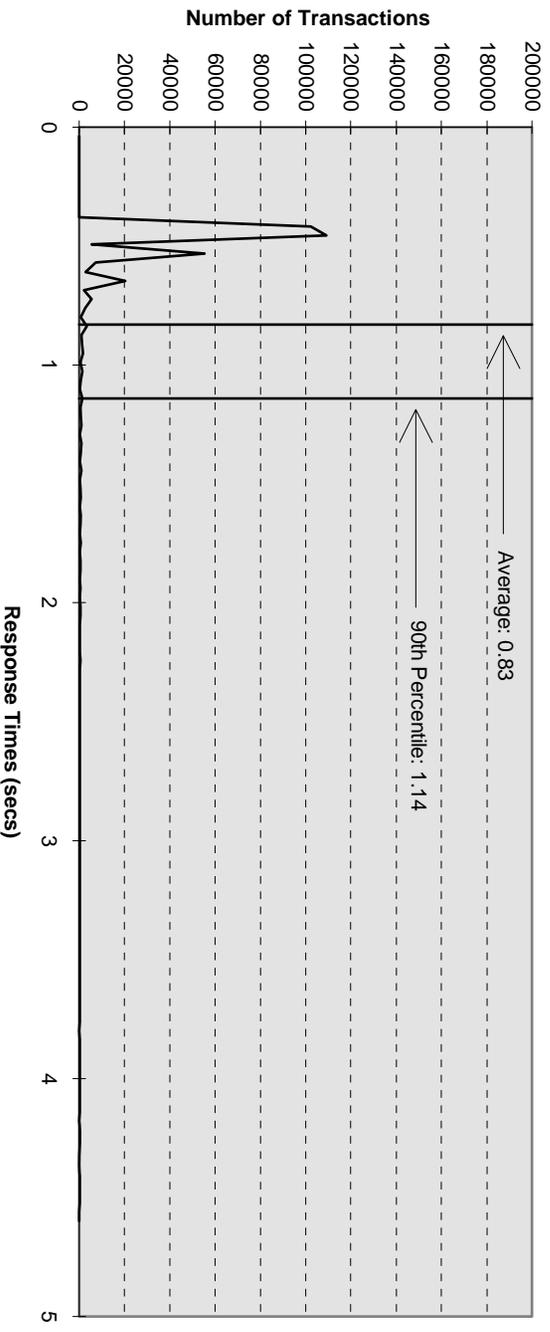

Table 5.3: Think Times

| Transaction  | Minimum | Average | Maximum |
|--------------|---------|---------|---------|
| New-Order    | 0.00    | 12.23   | 120.00  |
| Payment      | 0.00    | 12.23   | 120.00  |
| Delivery     | 0.00    | 5.11    | 50.00   |
| Stock-Level  | 0.00    | 5.08    | 50.00   |
| Order Status | 0.00    | 10.22   | 100.00  |

## 5.4. Response Time Frequency Distribution Curves

*Response Time frequency distribution curves (see Clause 5.6.1) must be reported for each transaction type.*

**Figure 5.1: New Order Response Time Distribution**  
**New Order Response Times**

**Figure 5.2: Payment Response Time Distribution**  
**Payment Response Times**

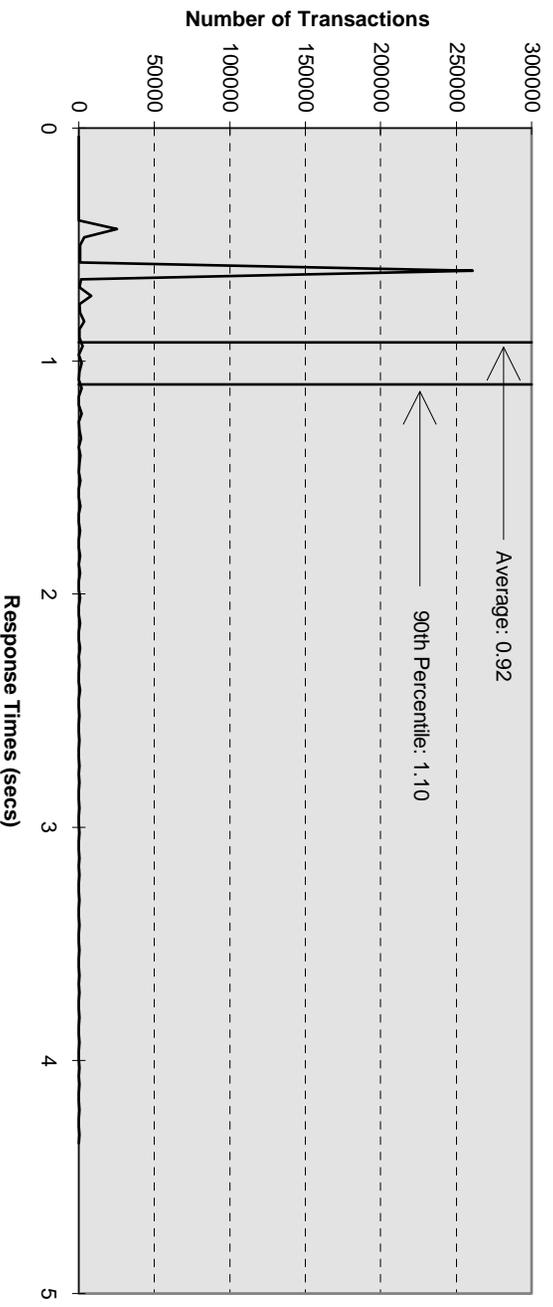

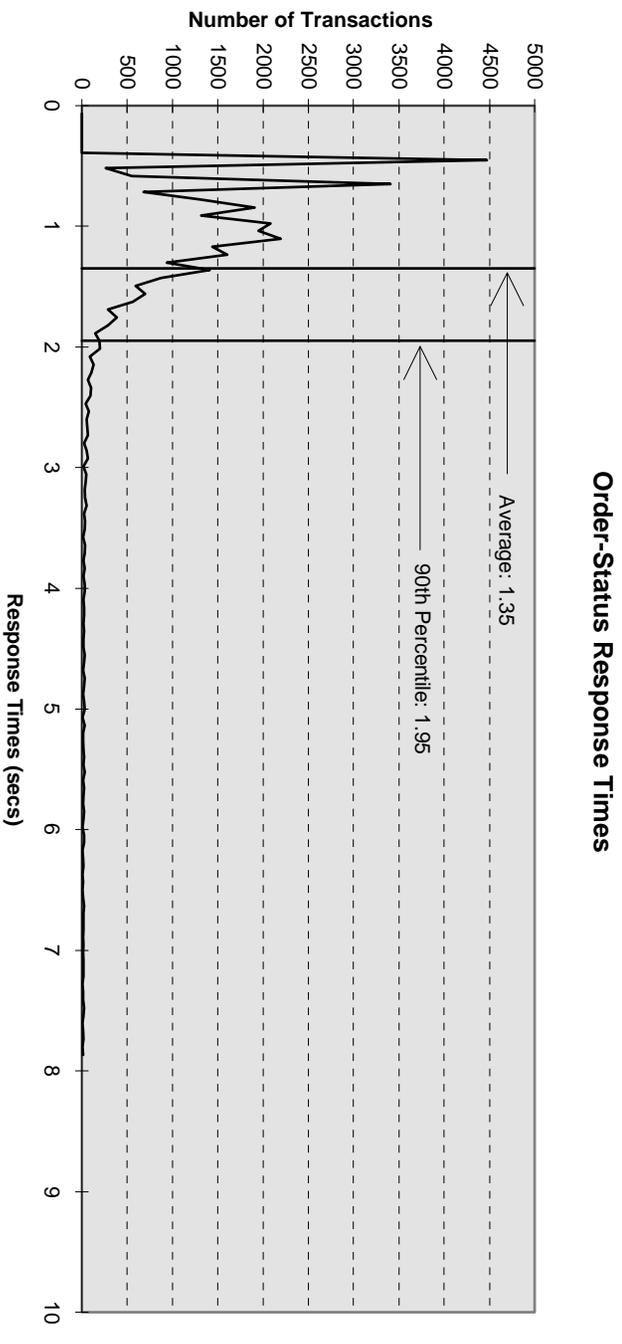

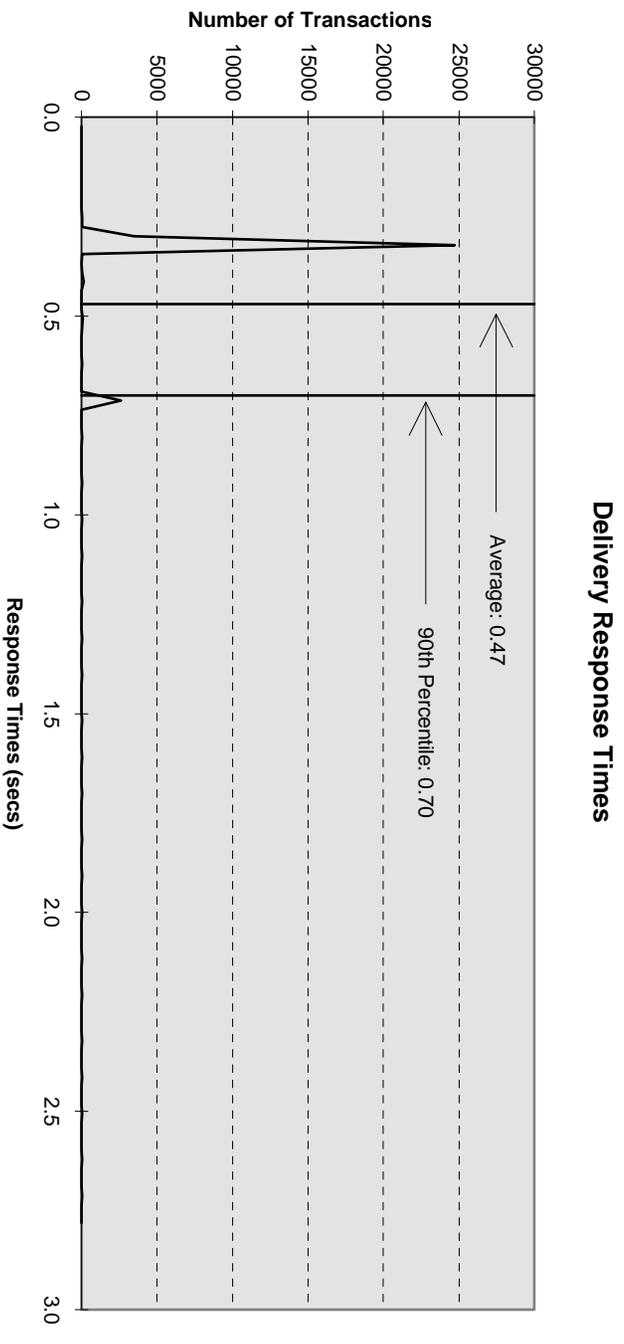

Figure 5.3: Order Status Response Time Distribution

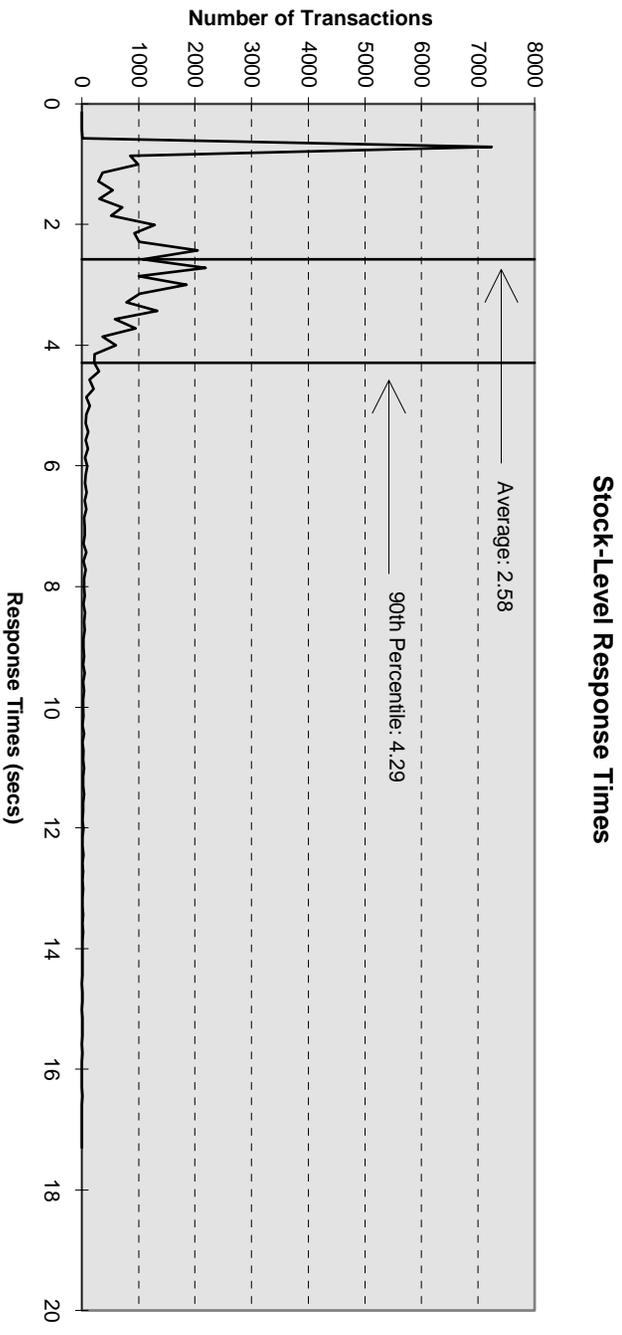

**Order-Status Response Times**

Figure 5.4: Delivery Response Time Distribution

**Delivery Response Times**

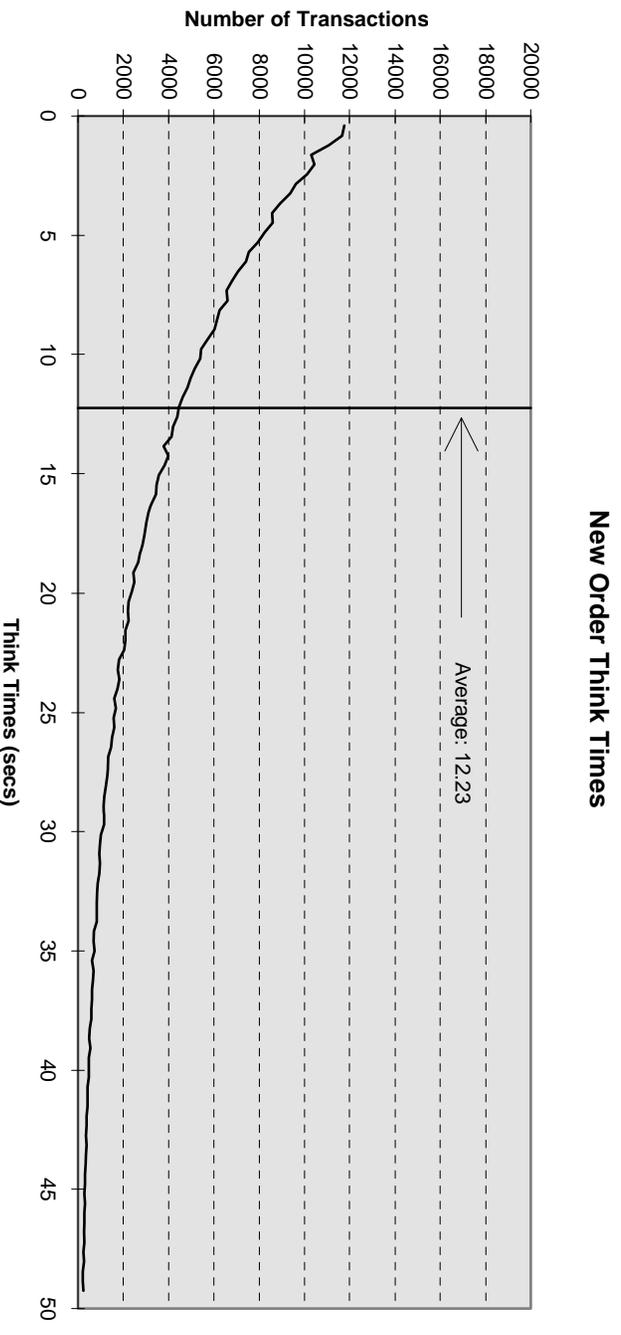

Figure 5.5: Stock Level Response Time Distribution

## 5.5. New Order Think Time Frequency Distribution Curve

*Think Time frequency distribution curve (see Clause 5.6.3) must be reported for the New-Order transaction.*

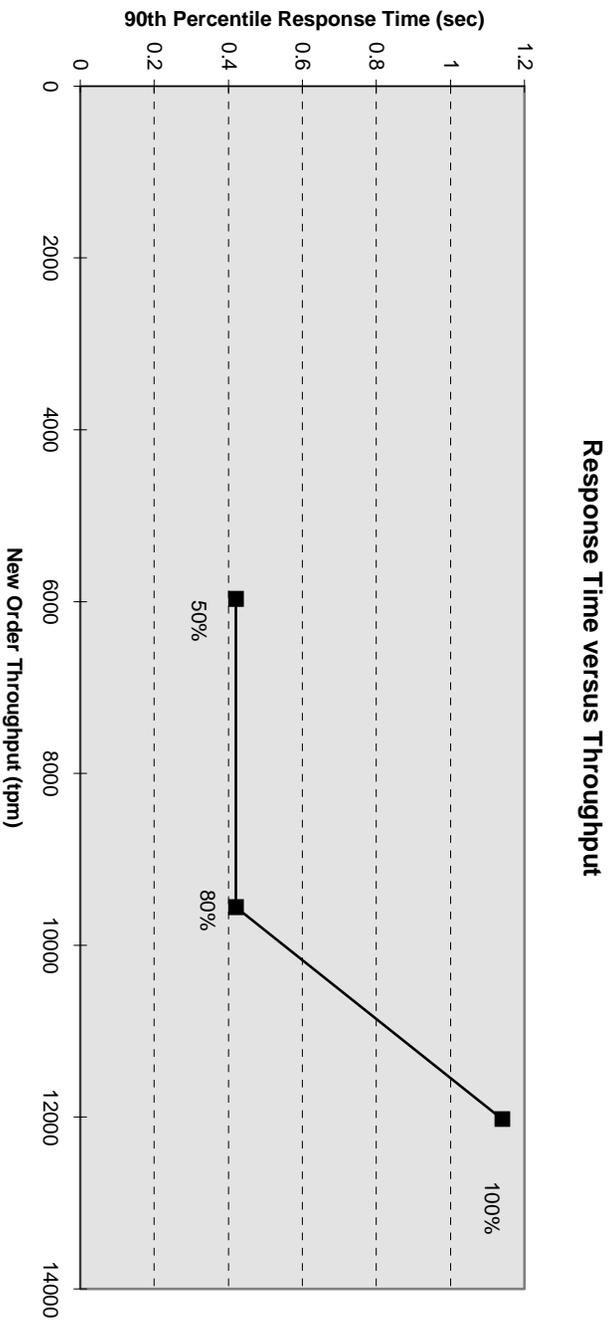

Figure 5.6: New Order Think Time Distribution

## 5.6. Response Time versus Throughput Performance Curve

*The performance curve for response times versus throughput (Clause 5.6.2) must be reported for the New-Order transaction*

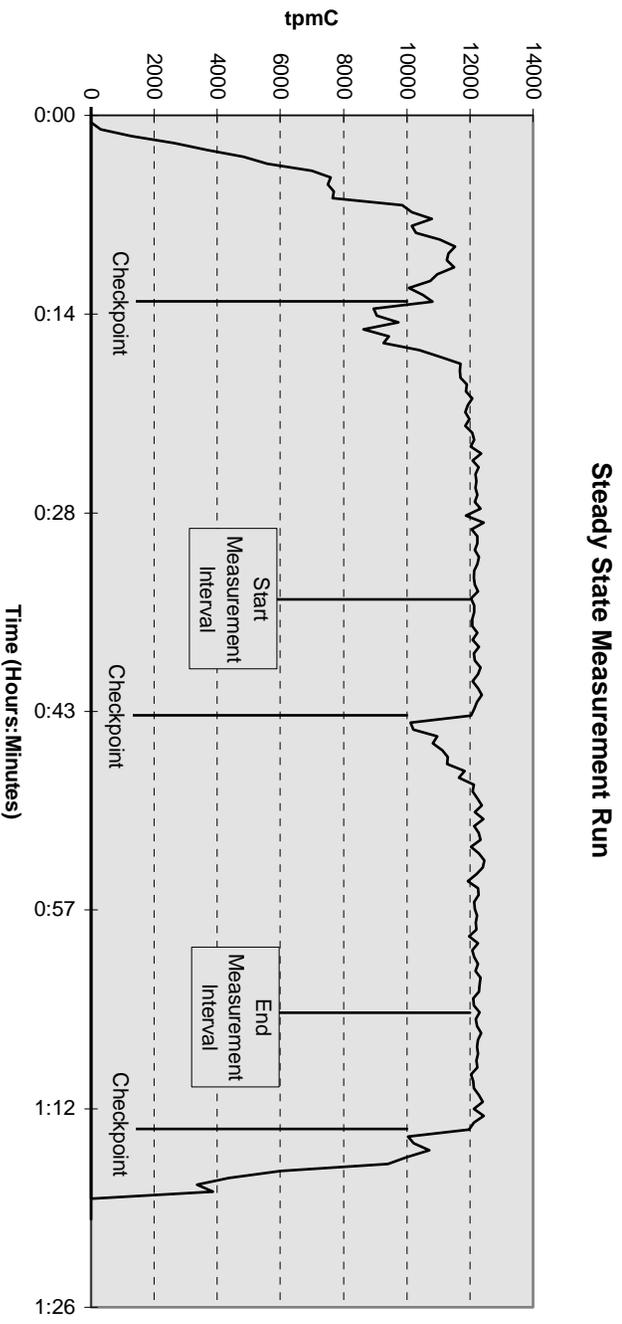

**Figure 5.7: Response Time versus Throughput**

## 5.7. New-Order Throughput vs. Time

A graph of throughput versus elapsed time (Clause 5.6.5) must be reported for the New-Order transaction.

Figure 5.8: Throughput (tpmC) versus Time

## 5.8. Determination of ‘Steady State’

*The method used to determine that the SUT had reached a steady state prior to commencing the measurement interval (see Clause 5.5) must be described.*

The transaction throughput rate (tpmC) and response time were relatively constant after the initial ‘ramp up’ period. The throughput and response time behavior were determined by examining data reported for each 30-second interval over the duration of the benchmark. Ramp-up, steady state, and ramp-down regions are discernible in the graph presented in Figure 5.8.

## 5.9. Work Performed During Steady State

*A description of how the work normally performed during a sustained test (for example checkpointing, writing redo/undo log records, etc.) actually occurred during the measurement interval must be reported.*

The RTE selects a transaction type from the menu and prepares to request the appropriate blank form. A timestamp is taken before the form request is sent and after the response is returned. The difference between the two is saved off as the menu response time. The RTE then generates input data for the transaction to create a completed form and waits the appropriate key time. A timestamp is taken before the completed form is sent and after the response is returned. The difference between these two is saved off as the transaction response time. Both response times are padded with a 0.1 second delay per spec to account for the web browser delay. The appropriate transaction data and response times are logged and the RTE waits the required think time interval before repeating the process. Each RTE driver maintains its own log file. Log file contents are consolidated for the reports.

The RTE emulates web browsers (not terminals) in this client-server implementation. The RTE sends and receives HTML formatted data using HTTP through Ethernet LANs to a client application running on the client machine. The client application processes the request, sends the transaction to a Tuxedo TPC-C application server queue, waits for the transaction response (except for delivery), and returns an appropriately formatted HTML form back to the (emulated) web browser (RTE). The Tuxedo TPC-C application server retrieves a message from its queue, invokes request processing via a stored procedure on the database server using Microsoft SQL Server DBLIB and RPC through sockets over another Ethernet LAN, accepts the response, and returns a result to the client application (via Tuxedo). For delivery transactions, the client application does not wait for the Tuxedo TPC-C delivery server to respond. Each delivery server logs its results to its own file. The delivery report files are consolidated for reports.

To perform checkpoints at specific intervals, SQL Server's checkpoint interval was set to the maximum allowable value and a script was written to schedule checkpoints at 30 minute intervals and record the start and end time of each checkpoint. The checkpoint script was started manually on one of the client machines after the RTE had all users logged in and sending transactions and a steady state had been achieved. Using this information, the positioning of the checkpoint within the measurement interval was verified to be clear of the guard zones.

At each checkpoint, SQL Server wrote to disk all database pages in memory that had been updated but not yet physically written to the disk. Upon completion of the checkpoint, SQL Server also wrote records to the transaction log indicating that a checkpoint had completed.

## 5.10. Reproducibility

*A description of the method used to determine the reproducibility of the measurement results must be reported.*

In a repeat test, carried out in the same manner as the primary test, a throughput of 11922.50 ipmC was achieved on the same database during a 30-minute, steady state run. All required transaction statistics were met. See the Auditor's attestation letter for details.

## 5.11. Measurement Interval Duration

*A statement of the duration of the measurement interval for the reported Maximum Qualified Throughput (ipmC) must be included.*

The measurement interval was 30 minutes.

## 5.12. Regulation of Transaction Mix

*The method of regulation of the transaction mix (e.g. card decks or weighted random distribution) must be described. If weighted distribution is used and the RTE adjusts the weights associated with each transaction type, the maximum adjustments to the weight from the initial value must be disclosed.*

The RTE was given a weighed random distribution which was not adjusted during the run. The transaction weights were defined as follows:

|                   |       |
|-------------------|-------|
| NEW_ORDER_PROB    | .4476 |
| PAYMENT_PROB      | .4309 |
| DELIVER_PROB      | .0405 |
| STOCK_LEVEL_PROB  | .0405 |
| ORDER_STATUS_PROB | .0405 |

## 5.13. Transaction Statistics

*The percentage of the total mix for each transaction type must be disclosed.*

*The percentage of New-Order transactions rolled back as a result of invalid item number must be disclosed.*

*The average number of order-lines entered per New-Order transaction must be disclosed.*

*The percentage of remote order-lines entered per New-Order transaction must be disclosed.*

*The percentage of remote Payment transactions must be disclosed.*

*The percentage of customer selections by customer last name in the Payment and Order-Status transactions must be disclosed.*

*The percentage of Delivery transactions skipped due to there being fewer than necessary orders in the New-Order table must be disclosed.*

Table 5.4 shows this information.

**Table 5.4: Transaction Statistics**

| Transaction Type | Statistics                            | Value          |
|------------------|---------------------------------------|----------------|
| New Order        | Rolledback transactions               | 1.00%          |
|                  | Home warehouse                        | 99.00%         |
|                  | Remote warehouse                      | 1.00%          |
|                  | Average Items per Order               | 10.00          |
| Payment          | Home warehouse                        | 85.03%         |
|                  | Remote warehouse                      | 14.97%         |
|                  | Non-primary key access                | 60.06%         |
| Order Status     | Non-primary key access                | 60.06%         |
| Delivery         | Skipped transactions (Interactive)    | 0              |
|                  | Skipped transaction counts (Deferred) | 0              |
|                  | Skipped District counts (Deferred)    | 0              |
| Transaction Mix  | New Order                             | 44.72%         |
|                  | Payment                               | 43.09%         |
|                  | Delivery                              | 4.08%          |
|                  | Stock-Level<br>Order-Status           | 4.03%<br>4.08% |

## 5.14. Checkpoint Statistics

*The number of checkpoints in the measurement interval, the time in seconds from the start of the measurement interval to the first checkpoint, and the Checkpoint Interval must be disclosed.*

There is one checkpoint in the measurement interval. The checkpoint starts nine minutes into the measurement interval. The checkpoint interval is 30 minutes (from the start of one to the start of the next) and a checkpoint lasts approximately four minutes. In conformance with Clause 5.2.2 there is no checkpoint within a span of 7.5 minutes before or after the beginning or end of the measurement interval.

## **6. Clause 6: SUT, Driver & Communications Definition**

### **6.1. Remote Terminal Emulator (RTE) Description**

*The RTE input parameters, code fragments, functions, etc. used to generate each transaction input field must be disclosed.*

The RTE used is proprietary to Unisys. Appendix D contains the profile used as input to this RTE.

### **6.2. Emulated Components**

*It must be demonstrated that the functionality and performance of the components being emulated in the Driver System are equivalent to that of the priced system.*

There were no emulated components in the benchmark configuration other than the emulated web browsers on the users' PCs.

### **6.3. Functional Diagrams**

*A complete functional diagram of both benchmark and the configuration of the proposed (target) system must be disclosed. A detailed list of all hardware and software functionality being performed on the Driver System and its interface to the SUT must be disclosed.*

Section 0.7 describes and shows functional diagrams of the benchmarked and priced systems.

### **6.4. Network Configuration**

*The network configuration of both the tested and proposed (target) services which are being represented and a thorough explanation of exactly which parts are being replaced with the Driver System must be disclosed.*

Figures 0.1 and 0.2 in Section 0.7 also diagram the network configurations of the benchmark and configured systems and represent the RTEs connected via LAN replacing the user PCs that are directly connected via LAN.

### **6.5. Network Bandwidth**

*The bandwidth of the network(s) used in the tested/priced configuration must be disclosed.*

Ethernet local area networks (LAN) with a bandwidth of 10 megabits per second are used in the tested/priced configurations between RTE/emulated web browsers and the client machines. A single Ethernet LAN with a bandwidth of 100 megabits per second is used between the client machines and the database server (SUT).

Each of the clients contains one 100 megabit per second LAN adapter and two 10 megabit per second LAN adapters. The 100 megabit per second LAN adapter is connected to a single LAN segment and to the database server in both priced and tested configurations.

In the priced configuration, the clients are each connected via two 10Mbit LAN segments to workstations (PCs running web browsers).

In the tested configuration, each client also contains two 10 megabit per second LAN adapters. Each LAN adapter connects to a LAN adapter on an RTE (driver) machine.

## **6.6. Operator Intervention**

*If the configuration requires operator intervention (see Clause 6.6.6), the mechanism and the frequency of this intervention must be disclosed.*

No operator intervention was required to sustain eight hours of operation at the reported throughput.

# 7.

## Clause 7: Pricing

### **7.1. Pricing**

*A detailed list of hardware and software used in the priced system must be reported. Each separately orderable item must have vendor part number, description, and release/revision level, and either general availability status or committed delivery date. If package-pricing is used, vendor part number of the package and a description uniquely identifying each of the components of the package must be disclosed. Pricing source(s) and effective date(s) must also be reported.*

*The total 5-year price of the entire configuration must be reported, including: hardware, software, and maintenance charges. Separate component pricing is recommended. The basis of all discounts used must be disclosed.*

*System pricing should include subtotals for the following components: Server Hardware, Server Software, Client Hardware, Client Software, and Network Components used for terminal connection (see Clause 7.2.2.3). Clause 6.1 describes the Server and Client components.*

*System pricing must include line item indication where non-sponsoring companies' brands are used. System pricing must also include line item indication of third party pricing.*

A detailed list of hardware and software components along with their part numbers and prices are given in the Executive Summary near the beginning of this document.

### **7.1.1. System Pricing**

Each priced configuration consists of an integrated system package, additional options, and components. Prices for all products are US list prices. A three year warranty is standard with this class of Unisys server products.

### **7.1.2. Maintenance Pricing**

The five year support pricing for Unisys Corporation Open Business Server products is based on a 36-month warranty on hardware and 24 months of monthly support. Microsoft and BEA support pricing is based on 60 months of monthly support costs.

Unisys Corporation Standard Performance-Gold Support: four hour maximum response, onsite support for hardware provides service from 8:00 A.M. to 5:00 P.M., Monday through Friday. Service requests made as late as 5:00 P.M. will receive a response the same day.

Western Micro, Netlux and ALR provide return-to-factory replacement within seven days. Appropriate spares are included in the priced configuration.

### **7.1.3. Discounts**

No discounts were applied to the priced configuration.

## 7.2. Availability

*The committed delivery date for general availability (availability date) of products used in the price calculation must be reported. When the priced system includes products with different availability dates, the reported availability date for the priced system must be the date at which all components are committed to be available.*

The hardware, software and support/maintenance products priced in this benchmark are detailed on page vi.

Server Hardware, Microsoft NT Server 4.0 Enterprise Edition and SQL Server 6.5 Enterprise Edition will be available by November 30<sup>th</sup>, 1997. All other components are available now.

## 7.3. Measured tpmC, Price/Performance, and Availability Date

*A statement of the measured tpmC as well as the respective calculations for the 5-year pricing, price/performance (price/tpmC), and the availability date must be included.*

Unisys Corporation Aquanta HS/6 Server, with Microsoft Windows NT Server 4.0 Enterprise Edition and SQL Server 6.5 Enterprise Edition, achieved 12,026.07 tpmC at \$39.38 per tpmC. All components will be available by November 30<sup>th</sup>, 1997.

## 7.4. Country-Specific Pricing

*Additional Clause 7 related items may be included in the Full Disclosure Report for each country specific priced configuration. Country specific pricing is subject to Clause 7.1.7.*

None.

## 7.5. Usage Pricing

*For any usage pricing, the sponsor must disclose:*

- *Usage level at which the component was priced.*
- *A statement of the company policy allowing such pricing.*

The component pricing based on usage is shown below:

- One (1) Microsoft Windows NT Server 4.0 Enterprise Edition license
- One (1) Microsoft SQL 6.50 Server Enterprise Edition license
- Five (5) Microsoft Windows NT 4.0 Licenses
- One (1) Microsoft SQL Server Programmers Toolkit
- One (1) Microsoft Visual C++ Subscription
- Five (5) BEA Tuxedo 6.3 CFS for NT licenses

Microsoft SQL Server & Internet Information Server and BEA Tuxedo were priced for an unlimited number of users.

## 8.

### ***Clause 8 : Full Disclosure Availability***

#### **8.1. Availability**

*The Full Disclosure Report must be readily available to the public at a reasonable charge, similar to charges for similar documents by that test sponsor.*

Copies of this Full Disclosure Report may be obtained by contacting:

TPC Benchmark Administrator  
Systems Analysis, Modeling & Measurement Group  
Unisys Corporation, M/S 262  
25725 Jeronimo Road  
Mission Viejo, CA 92691  
USA

## **9.**

## ***Clause 9 : Audit***

### **9.1. Auditor's Report**

*The auditor's name, address, phone number and a copy of the auditor's attestation letter indicating compliance must be included in the Full Disclosure Report.*

This implementation of the TPC Benchmark C on the Unisys Aquanta HS/6 Server was audited by Richard Gimarc, a TPC certified auditor of:

Performance Metrics Inc.,  
2229 Benita Drive, Suite 101,  
Rancho Cordova, CA 95670.  
  
(916)635-2822 Fax: (916) 858-0109  
e-mail: Richard@PerfMetrics.com

The attestation letter is shown on the next page.

Jerold Buggert

Director of Modeling and Measurement

Unisys Corporation

25725 Jeronimo

Mission Viejo, CA 92691

August 13, 1997

I have verified the TPC Benchmark™ C for the following configuration:

Platform: Unisys Aquanta HS/6 Server

Database Manager: Microsoft SQL Server 6.5 Enterprise Edition

Operating System: Microsoft Windows NT Server 4.0 Enterprise Edition

Transaction Manager: BEA Tuxedo CFS 6.3 for NT

| CPU's                              | Memory                           | Disks                        | New-Order<br>Response Time<br>@ 90% | tpmC      |
|------------------------------------|----------------------------------|------------------------------|-------------------------------------|-----------|
| Server: Unisys Aquanta HS/6 Server |                                  |                              |                                     |           |
| 6 Pentium Pro<br>@ 200 MHz         | Main: 4 GB<br>L2 Cache: 1 MB     | 86 @ 4.05 GB<br>64 @ 8.48 GB | 1.14 sec.                           | 12,026.07 |
| 5 Clients: Unisys Aquanta DM/6 II  |                                  |                              |                                     |           |
| 1 Pentium Pro<br>@ 200 MHz         | Main: 256 MB<br>L2 Cache: 256 KB | 1 @ 1.51 GB                  | n.a.                                | n.a.      |

In my opinion, these performance results were produced in compliance with the TPC requirements for the benchmark.

The following attributes of the benchmark were given special attention:

- The transactions were correctly implemented.
- The database files were properly sized and populated.
- The database was properly scaled with 1,000 warehouses.
- The ACID properties were met, including phantom protection.
- The durability data loss and log loss tests were performed on a 10-warehouse database.
- Input data was generated according to the specified percentages.

Page 1

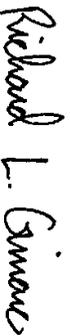

**PERFORMANCE METRICS INC.**  
**TPC Certified Auditors**

---

- Eight hours of mirrored log space was configured on the measured system.
- The following disks contained backup and other data and were not active during measurement: four 4.05 GB and sixteen 8.48 GB disks. These 20 disks were not included in the priced configuration.
- The 180-day space calculation was verified. Two 8.48 GB disks were added to the priced configuration to satisfy this requirement.
- Measurement cycle times include a 0.1 second menu and a 0.1 second response time delay for an emulated Web browser.
- The steady state portion of the test was 30 minutes.
- One checkpoint was taken during the steady state portion of the test.
- Checkpoints were verified to be clear of the guard zones.
- There were 10,000 user contexts present on the system.
- Each emulated user started with a different random number seed.
- The NURand constants used for database load and at run time were verified.
- System pricing was checked for major components and maintenance.

Additional Audit Notes: (none)

Regards,

Richard L. Gimarc  
Auditor

## **Appendix C - Tunable Parameters**

### **Microsoft Windows NT 4.0 Configuration Parameters**

There were no Windows NT Registry parameters that were changed from their default settings. The following services were disabled in the Windows NT Control Panel/ Services on the Server:

- License Logging Service
- NT LM Security Support Provider
- Plug and Play
- Spooler

### **Microsoft SQL Server Startup Parameters**

```
c:\mssql\bin\sqlservr -c -x -t1081 -T812 -T3502 -Cd1448000 -Cp6000
```

Where:

- -c Start SQL Server independently of the Service Control Manager
- -x Disables the keeping of CPU time and cache hit ratio statistics
- -t1081 Allows the index pages a “second” trip through the cache
- -T812 Disables checkpoint buffer sorting
- -T3502 Writes a message to the SQL Server Errorlog showing the beginning and ending time of each checkpoint
- -Cd1448000 Defines the number of 2KB database cache buffers
- -Cp6000 Defines the number of buffers for the procedure cache

### **SQL Server Stack Size**

The default stack size for Microsoft SQL Server 6.5.SP4 (6.50.253) was changed using the EDITBIN utility. The EDITBIN utility ships with Microsoft Visual C++ V4.0. The command used to change the stack size is:

```
editbin /S: 65536 sqlservr.exe
```

This command is fully documented as an article in the Microsoft Knowledge Base on the Microsoft Web Site at [www.microsoft.com/support](http://www.microsoft.com/support).

### **DBCC GAMINIT**

Prior to the execution of the benchmark, the following script was run to proactively populate the Global Allocation Map (GAM) rather than allowing it to be populated on an as-needed basis.

```
Use tpcc  
go  
dbcc gaminit  
go
```

This command is fully documented as an article in the Microsoft Knowledge Base on the Microsoft Web Site at [www.microsoft.com/support](http://www.microsoft.com/support).

### **‘Cache’ Column of Sysobjects Table**

Prior to the execution of the benchmark, the following script was run and SQL Server was restarted to improve cache performance of tables which are accessed non-uniformly. Use of this feature is fully documented as an article in the Microsoft Knowledge Base on the Microsoft Web Site at [www.microsoft.com/support](http://www.microsoft.com/support).

```

Use tpcc
go
update sysobjects set cache=2 from sysobjects where name='stock'
go
update sysobjects set cache=5 from sysobjects where name='customer'
go

```

## BOOT.INI

The /3gb switch was added to the boot.ini file to cause NT Server to allow 3GB of user and 1GB of kernel virtual address space, rather than the usual 2GB of virtual address space for each.

## Microsoft SQL Server Startup Parameters

```

Key Name:          SOFTWARE\Microsoft\MSSQLServer\MSSQLServer\Parameters
Class Name:        <NO CLASS>
Last Write Time:   6/25/97 - 9:42 PM
Value 0
  Name:            SQLArg0
  Type:            REG_SZ
  Data:            -dC:\MSSQL\DATA\MASTER.DAT
Value 1
  Name:            SQLArg1
  Type:            REG_SZ
  Data:            -eC:\MSSQL\LOG\ERRORLOG

```

## Configuration of Log Drives

There were four mirrored pairs of log drives, with four log drives housed in one independently powered disk cage and their four mirrors housed in a second independently powered disk cage. Each disk cage contained redundant power supplies. The two disk cages were attached to two channels of the seventh RAID controller. The controller was configured to stripe log IO across the four pairs of log drives and to use Write Thru, No Read Ahead and DirectIO (no read or write caching in the RAID controller).

The log disk drives themselves have large data buffers and support both Read Cache Enable (RCE, Factory enabled) and Write Cache Enable (WCE, Factory disabled). All disk writes first load data into the disk buffer. If WCE is enabled, IO completion is signaled immediately, and data is transferred to the media as soon as possible. If WCE is disabled, IO completion is not signaled until after the data is transferred to the media.

The four pairs of (hot-pluggable) log drives were moved from their RAID disk cages to the internal drive cage in the system (accessible from the front door). The latter is connected to an in-built Adaptec SCSI controller. Adaptec's EZ-SCSI software (provided with the base system) SCSI Explorer was used to rescan the SCSI bus and change the setting of WCE for each log drive to enabled. The log drives were then moved back into their RAID disk cages.

For the priced configuration, a UPS was attached to one of the redundant power supplies of both log disk cages. Since even with WCE enabled, the log drives will transfer the data from the buffer to the media as soon as possible (i.e., during the next disk revolution

for sequential writes), the existence of the UPS guarantees that a loss of system power will not stop the writes from occurring to the disk media after IO completion is signaled to the RAID controller and system. Since there is no single point of failure in this configuration, it meets the TPC-C requirements of guaranteeing the durability of all committed transactions.

## NT Server Configuration Information

Microsoft Diagnostics Report For \\HS6SUT

-----  
OS Version Report

-----  
Microsoft (R) Windows NT (TM) Server  
Version 4.0 (Build 1381: Service Pack 3) x86 Multiprocessor Free  
Registered Owner: SAM&M, Unisys Corporation  
Product Number: 50382-123-1234567-69937  
-----

System Report

-----  
System: AT/AT COMPATIBLE  
Hardware Abstraction Layer: MPS 1.4 - APIC platform  
BIOS Date: 04/09/97  
BIOS Version: PhoenixBIOS 4.0 Release 5.16.4B

Processor list:

```
0: x86 Family 6 Model 1 Stepping 9 GenuineIntel ~200 Mhz
1: x86 Family 6 Model 1 Stepping 9 GenuineIntel ~200 Mhz
2: x86 Family 6 Model 1 Stepping 9 GenuineIntel ~200 Mhz
3: x86 Family 6 Model 1 Stepping 9 GenuineIntel ~200 Mhz
4: x86 Family 6 Model 1 Stepping 9 GenuineIntel ~200 Mhz
5: x86 Family 6 Model 1 Stepping 9 GenuineIntel ~200 Mhz
```

-----  
Video Display Report

-----  
BIOS Date: 09/02/94  
BIOS Version: CL-GD5429 VGA BIOS Version 1.00a

Adapter:

```
Setting: 1024 x 768 x 256
        72 Hz
Type: cirrus compatible display adapter
String: Cirrus Logic Compatible
Memory: 1 MB
Chip Type: CL 5429
DAC Type: Integrated RAMDAC
```

Driver:

```
Vendor: Microsoft Corporation
File(s): cirrus.sys, vga.dll, cirrus.dll, vga256.dll, vga64K.dll
Version: 4.00, 4.0.0
```

Subject: Pricing for Tuxedo 6.3

Dear Mr. Buggert:

This letter is to confirm our policy on Tuxedo versions' general availability and prices. At present we are in the process of removing Tuxedo 4.2.2 (from BEA, ITI, IMC or Novell) from general availability. It is replaced by Tuxedo 6.x from BEA Systems, Inc.

For purposes of TPC activity we recommend the use of Tuxedo 6.3 available through our Core Functionality Services (CFS) program. This is a replacement for version 4.2.2 or earlier. This is a generally available product and should be denoted as Tuxedo 6.3 CFS in all publications. It is priced as shown below.

## BEA Tuxedo Core Functionaty Services Program License Fees Per Server

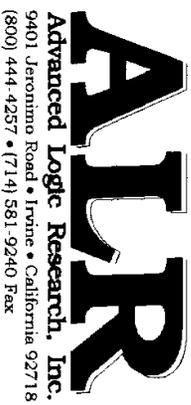

| Unlimited User License fees per server                                | Number of Users | Dollar Amount | Maintenance (5 x 8) per year | Maintenance (7 x 24) per year |
|-----------------------------------------------------------------------|-----------------|---------------|------------------------------|-------------------------------|
| Tier 1 -- PC Servers with 1 or 2 CPUs, RISC Uniprocessor Workstations | Unlimited       | \$3,000.00    | \$450.00                     | \$660.00                      |
| Tier 2 - PC Servers with 3 or 4 CPUs, Midrange and UNIX Systems       | Unlimited       | \$12,000.00   | \$1,800.00                   | \$2,640.00                    |
| Tier 3 - Midrange Multiprocessors, up to 8 CPUs per system capacity   | Unlimited       | \$30,000.00   | \$4,500.00                   | \$6,600.00                    |
| Tier 4 - Large (8 - 32 CPUs) and Mainframe Systems                    | Unlimited       | \$100,000.00  | \$15,000.00                  | \$22,000.00                   |
| Tier 5 - Massively Parallel Systems, > 32 processors                  | Unlimited       | \$250,000.00  | \$37,500.00                  | \$55,000.00                   |

Sincerely,

Lew Brentano

Dear Rick,

Following, please find the prices for the products/services you have requested.

Quick Hot Swap Storage Drawer II (7u) #11910190      \$1,795 SRP

5 Year Warranty/Factory Depot Service (ALR-Irvine, CA) for the above mentioned drawer (11910190).  
This price is based on a one time purchase of 16 drawers for each service, and is based upon a 7 day  
repair or replenishment turn around time.

Price per drawer:      \$431.00 each.

If you have any questions please contact me immediately at (800) 444-4257 x 2260.

Sincerely,

Julie Dufur  
Account Manager  
OEM Sales

Dear Jerry,

Microsoft has received your request for permission to disclose the results of TPC-C benchmark tests conducted by Unisys with Microsoft SQL Server 6.5 Enterprise Edition on the following system:

Unisys Aquanta HS/6 Server, 6-processors, Pentium Pro, 200 MHz, 1MB cache  
Test Results: 12000 ipmC approx., \$39/ipmC approx.

Microsoft hereby grants Unisys permission to disclose these results to third parties and acknowledges that Unisys has formally requested permission to do so in accordance with the license agreement for Microsoft SQL Server Enterprise Edition software.

Best regards,

Sid Arora  
Product Manager, Microsoft SQL Server  
Personal and Business Systems Group
